

HITACHI PROGRAMMABLE CONTROLLER

HIDIC MICRO-EH

APPLICATION MANUAL

WARNING

To ensure that the equipment described by this manual. As well as all equipment connected to and used with it, operate satisfactorily and safely, all applicable local and national codes that apply to installing and operating the equipment must be followed. Since code can vary geographically and can change with time, it is the user's responsibility to determine which standard and codes apply, and to comply with them.

FAILURE TO COMPLY WITH APPLICABLE CODES AND STANDARDS CAN RESULT IN DAMAGE TO EQUIPMENT AND / OR SERIOUS INJURY TO PERSONNEL.
INSTALL EMERGENCY POWER STOP SWITCH WHICH OPERATES INDEPENDENTLY OF THE PROGRAMMABLE CONTROLLER TO PROTECT THE EQUIPMENT AND / OR PERSONNEL IN CASE OF THE CONTROLLER MALFUNCTION.

Personnel who are to install and operate the equipment should carefully study this manual and any others referred to by it prior to installation and / or operation of the equipment. Hitachi, Ltd. constantly strives to improve its products, and the equipment and the manual(s) that describe it may be different from those already in your possession.

If you have any questions regarding the installation and operation of the equipment, or if more information is desired, contact your local Authorized Distributor or Hitachi, Ltd.

IMPORTANT

THIS EQUIPMENT GENERATES, USES, AND CAN RADIATE RADIO FREQUENCY ENERGY AND, IF NOT INSTALLED AND USED IN ACCORDANCE WITH THE INSTRUCTION MANUAL, MAY CAUSE INTERFERENCE TO RADIO COMMUNICATIONS. AS TEMPORARILY PERMITTED BY REGULATION, IT HAS NOT BEEN TESTED FOR COMPLIANCE WITH THE LIMITS FOR CLASS A COMPUTING DEVICES PURSUANT TO SUBPART J OF PART 15 OF FCC RULES, WHICH ARE DESIGNED TO PROVIDE REASONABLE PROTECTION AGAINST SUCH INTERFERENCE.

OPERATION OF THIS EQUIPMENT IN A RESIDENTIAL AREA IS LIKELY TO CAUSE INTERFERENCE IN WHICH CASE THE USER, AT HIS OWN EXPENSE, WILL BE REQUIRED TO TAKE WHATEVER MEASURES MAY BE REQUIRED TO CORRECT THE INTERFERENCE.

LIMITED WARRANTY AND IMITATION OF LIABILITY

Hitachi, Ltd. (Hitachi) warrants to the original purchaser that the programmable controller (PLC) manufactured by Hitachi is free from defects in material and workmanship under normal use and service. The obligation of Hitachi under this warranty shall be limited to the repair or exchange of any part or parts which may prove defective under normal use and service within eighteen (18) months from the date of manufacture or twelve (12) months from the date of installation by the original purchaser which ever occurs first, such defect to be disclosed to the satisfaction of Hitachi after examination by Hitachi of the allegedly defective part or parts. This warranty is expressly in lieu of all other warranties expressed or implied including the warranties of merchantability and fitness for use and of all other obligations or liabilities and Hitachi neither assumes, nor authorizes any other person to assume for Hitachi, any other liability in connection with the sale of this PLC. This warranty shall not apply to this PLC or any part hereof which has been subject to accident, negligence, alteration, abuse, or misuse. Hitachi makes no warranty whatsoever in respect to accessories or parts not supplied by Hitachi. The term "original purchaser", as used in this warranty, shall be deemed to mean that person for whom the PLC is originally installed.

In no event, whether as a result of breach of contract, warranty, tort (including negligence) or otherwise, shall Hitachi or its suppliers be liable for any special, consequential, incidental or penal damages including, but not limited to, loss of profit or revenues, loss of use of the products or any associated equipment, damage to associated equipment, cost of capital, cost of substitute products, facilities, services or replacement power, down time costs, or claims of original purchaser's customers for such damages.

To obtain warranty service, return the product to your distributor, or send it with a description of the problem, proof of purchase, post paid, insured, and in a suitable package to:

Quality Assurance Dep.
Hitachi Industrial Equipment Systems Co., Ltd.

All Rights reserved - Printed in Japan

The information and/or drawings set forth in this document and all rights in and to inventions disclosed herein and patents which might be granted thereon disclosing or employing and the materials, techniques or apparatus described herein are the exclusive property of Hitachi, Ltd.

No copies of the information or drawings shall be made without the prior consent of Hitachi, Ltd.

Hitachi, Ltd. provides customer assistance in varied technical areas. Since Hitachi does not possess full access to data concerning all of the uses and applications of customer's products, responsibility is assumed by Hitachi neither for customer product design nor for any infringements of patents or rights of others which may result from Hitachi assistance.

The specifications and descriptions contained in this manual were accurate at the time they were approved for printing. Since Hitachi, Ltd. Incorporated constantly strives to improve all its products, we reserve the right to make changes to equipment and/or manuals at any time without notice and without incurring any obligation other than as noted in this manual.

Hitachi, Ltd. assumes no responsibility for errors that may appear in this manual.

As the product works with user program and Hitachi, Ltd. cannot test all combination of user program components, it is assumed that a bug or bugs may happen unintentionally. If it is happened: please inform the fact to Hitachi, Ltd. or its representative. Hitachi will try to find the reason as much as possible and inform the countermeasure when obtained.

Nevertheless Hitachi, Ltd. intends to make products with enough reliability, the product has possibility to be damaged at any time. Therefore personnel who are to install and operate the equipment has to prepare with the counter-measure such as power off switch can be operated independently of the controller. Otherwise, it can result in damage to equipment and/or serious injury to personnel.

Safety Precautions

Read this manual and attached documents thoroughly before installing and operating this unit, and performing maintenance or inspection of this unit in order to use the unit correctly. Be sure to use this unit after acquiring adequate knowledge of the unit, all safety information, and all precautionary information. Also, be sure to deliver this manual to the person in charge of maintenance.

Safety caution items are classified as “Danger” and “Caution” in this document.

: Cases in which, if handled incorrectly, a dangerous situation may occur, resulting in possible death or severe injury.

: Cases in which, if handled incorrectly, a dangerous situation may occur, resulting in possible minor to medium injury to the body, or only mechanical failure.

However, depending on the situation, items marked with  may result in major accidents.

Both of these items contain important safety information, so be sure to follow them closely.

Icons for prohibited items and required items are shown below:

: Indicates a prohibited item (item that cannot be performed). For example, when open flames are prohibited,  is shown.

: Indicates a required item (item that must be performed). For example, when grounding must be performed,  is shown.

1. Installation

CAUTION

- Use this product in an environment as described in the catalogue and this document.
If this product is used in an environment subject to high temperature, high humidity, excessive dust, corrosive gases, vibration or shock, it may result in an electric shock, fire or malfunction.
- Installation this product according to the instructions in this manual.
If installation is not performed correctly, it may result in falling, malfunction, or an operational error of the unit.
- Never allow foreign objects such as wire chips to enter the unit.
They may cause a fire, malfunction, or failure.

2. Wiring

REQUIRED

- Always perform grounding (FE terminal).
If grounding is not performed, there is a risk of an electric shock or malfunction.

CAUTION

- Connect a power supply that meets the rating.
If a power supply that does not meet the rating is connected, it may result in a fire.
- Any wiring operation should only be performed by a qualified technician.
If wiring is performed incorrectly, it may result in a fire, failure, or electric shock.

3. Precautions When Using the Unit

DANGER

- Never touch the terminals while the power is on.
There is a risk of an electric shock.
- Configure the emergency stop circuit, interlock circuit and other related circuits external to the programmable controller (referred to as the PLC in this document).
Otherwise, a failure in the PLC may damage the equipment or result in a serious accident.
Never interlock the unit with the external load via the relay drive power supply of the relay output module.

CAUTION

- Before performing program change, forced output, run, stop and other operations while the unit is in operation, be sure to check the validity of the applicable operation and safety.
An operation error may damage the equipment or result in a serious accident.
- Be sure to power on the unit according to the designated power-on sequence.
Otherwise, an erroneous operation may damage the equipment or result in a serious accident.

4. Maintenance

DANGER

- Never connect the \oplus and \ominus of the battery in reverse. Also, never charge, disassemble, heat, place in fire, or short circuit the battery.
There is a risk of an explosion or fire.

PROHIBITED

- Never disassemble or modify the unit.
These actions may result in a fire, malfunction, or failure.

CAUTION

- Be sure to turn off the power supply before removing or attaching the module/unit.
Otherwise, it may result in an electric shock, malfunction, or failure.

Revision History

No.	Description of Revision	Date of Revision	Manual Number
1	Appendix-1 Instruction Support FUN92 to 96 of H-4010 ○ -> ×. Appendix-2 Task code H28 Corrected explanation of Timer counter number.	2000/11	NJI-350 (X)
2	Postscript of battery error detection. (3.2 chapters item number 26, 15 chapters (4)) Correct a description of digital filter . (8.7 chapters) Addition of appendix 3.	2000/12	NJI-350A (X)
3	28 points expansion units added. Analog expansion module added. Circuit diagram added in chapter 3 FUN 5, TRNS/RECV command added in chapter 5.	2003/10	NJI-350B (X)

13.1	Error Display and Actions.....	13-1
13.2	Checklist when Abnormality Occurred	13-5
13.3	Procedures to Solve Abnormality	13-6
Chapter 14	Operation Examples	14-1 to 14-16
Chapter 15	Daily and Periodic Inspections.....	15-1 to 15-2
Appendix 1	H-Series Instruction Support Comparison Chart.....	A-1
Appendix 2	Standards.....	A-11

MEMO

Chapter 1 Features

1. **Multifunctional all-in-one type PLC**
The MICRO-EH is a multifunctional all-in-one type PLC that contains all necessary parts—a power supply and CPU parts as well as I/O units—within one unit.
Three sizes of PLCs are available: 10, 14, and 28 points. A type with 23 points plus three points of analog I/O having the same size as the 28-point PLC is also available. Moreover, for PLCs with more than 14 points, it is possible to install additional 14 or 28 point expansion units up to four units. Thus, the MICRO-EH can control a wide range of systems from small to medium size.
2. **Simplified positioning by counter inputs and pulse train outputs**
The function of inputs/outputs can be selected from four modes. By selecting a mode, inputs/outputs that are used as normal inputs/outputs can be set as counter inputs and pulse train outputs. Through a combination of these special inputs/outputs, it is possible to control positioning without using special modules.
3. **Simplified instrument system by analog integration**
For the 23-point PLC, there are two points of analog input and one point of analog output for which both current and voltage can be selected. High performance analog channels, with a resolution of 12 bits and an overall accuracy of $\pm 1\%$ or less, can be used without requiring special settings of the channels; thus, a simplified instrument system can easily be implemented.
4. **Superior upward compatibility**
The MICRO-EH has been developed as a part of the EH/H series family.
Debugging and programming can be performed using the same concept as for the EH/H series.
In addition, the MICRO-EH software property can effectively be applied to the EH/H series for future system expansion.
5. **Easy maintenance through removable terminal blocks and installation on a DIN rail**
All models of the MICRO-EH series support the DIN rail so that the PLC can easily be mounted and dismounted. In addition, the I/O section of the 14-point PLC or more utilizes a removable terminal block. Thus, erroneous and faulty wiring that may occur when connecting to external devices can be reduced.
6. **Remote maintenance through modem connection**
Communication with remote sites can be performed via dial-up line by connecting a modem to port 1 on the 14-point PLC or more of the MICRO-EH series. It is possible to monitor and manage remote systems from an office or monitor room.
7. **Easily adjustable potentiometer**
The 14-point PLC or more of the MICRO-EH series supports two potentiometers.
By using these potentiometers, it is possible to rewrite internal output values in real-time by one driver without using peripheral devices. Since the resolution of the potentiometer is 10 bits, it is possible to set any value from 0 to 3FFH. To obtain stable analog values of the potentiometers, it is possible to sample 1 to 40 analog values of the potentiometers and average them.
8. **Maintaining programs without a battery**
It is possible to retain user programs in case of out-of battery or no battery, since FLASH memory is used as the backup memory for the user programs. However, a battery is necessary for data memory backup. (See the Notes in Chapter 7.1 for a list of precautionary details.)
9. **Support for various programming languages**
The MICRO-EH supports “Pro-H,” the programming software that allows creating programs in five programming languages regulated in IEC1131-3. This means that customers who have learned languages other than Ladder can easily create programs with this programming software.
10. **Compliant with overseas specifications as standard**
All types of MICRO-EH PLCs have obtained the CE mark, C-TICK and UL. Therefore, systems in which these PLCs are installed can be exported without requiring any modification.

MEMO

Chapter 2 System Overview

This chapter describes the system configuration of the MICRO-EH.

The MICRO-EH is an all-in-one type programmable controller, and has the following system configuration.

Figure 2.1 10-point type system configuration diagram

Figure 2.2 14-point type system configuration diagram

Figure 2.3 23,28-point type system configuration diagram

No restriction for combination of 14,23,28 points, and basic/expansion unit.
 14 points basic unit can handle any type of expansion units, and 23/28 points basic unit as well.

No.	Device name	Description
1]	Basic unit	Calculates, imports inputs, and controls outputs according to the contents of user programs.
2]	Expansion unit	14 points digital unit, 4 in/2 out analog unit
3]	Expansion cable	Cable for connecting the basic unit and expansion unit, or between expansion units.

Chapter 3 Function and Performance Specifications

3.1 General Specifications

Item	Specification	
Power supply type	AC	DC
Power voltage	100/110/120 V AC (50/60 Hz), 200/220/240 V AC (50/60 Hz)	24 V DC
Power voltage fluctuation range	85 to 264 V AC wide range	19.2 to 30 V DC
Current consumption	Please refer to 4.7, "Weights and Power Consumption."	
Allowable momentary power failure	85 to 100 V AC: For a momentary power failure of less than 10 ms, operation continues 100 to 264 V AC: For a momentary power failure of less than 20 ms, operation continues	19.2 to 30 V DC: For a momentary power failure of less than 10 ms, operation continues
Operating ambient temp.	0 to 55 °C	
Storage ambient temp.	-10 to 75 °C	
Operating ambient humidity	5 to 95 % RH (no condensation)	
Storage ambient humidity	5 to 95 % RH (no condensation)	
Vibration proof	Conforms to JIS C 0911	
Noise resistance	<ul style="list-style-type: none"> ○ Noise voltage 1,500 Vpp Noise pulse width 100 ns, 1 μs (Noise created by the noise simulator is applied across the power supply module's input terminals. This is determined by our measuring method.) ○ Based on NEMA ICS 3-304 ○ Static noise: 3,000 V at metal exposed area ○ Conforms with EN50081-2 and EN50082-2 	
Supported standards	Conforms with UL, CE markings and C-TICK	
Insulation resistance	20 MΩ or more between the AC external terminal and the protection earth (PE) terminal (based on 500 V DC mega)	
Dielectric withstand voltage	1,500 V AC for one minute between the AC external terminal and the protection earth (PE) terminal	
Grounding	Class D dedicated grounding (grounded by a power supply module)	
Environment used	No corrosive gases and no excessive dirt	
Structure	Attached on an open wall	
Cooling	Natural air cooling	

3.2 Function Specifications

The functions available in the MICRO-EH are described in the table below.

No.	Item	Description
1	Basic functions	<p>The following functions can be executed when constructing a system using the PLC.</p> <ol style="list-style-type: none"> 1] An input signal is received from the control object, operations are performed according to the contents of the program created by the user and the results are output as an output signal. Also, operation results and progress information can be retained in the internal output area. 2] Power is supplied to the main module, system starts to run, and the operation described above is performed continuously until the power is shut down or the system stops running. 3] The information retained internally can be extracted by a device connected externally or can be set in other information. Also, this information is initialized at the time the system starts running, but it can also be retained depending on the user settings. 4] Operating status can be confirmed with the LED display of each unit or with an external device that has been connected.
2	Setting and display	<p>The following have been provided for the user to set or confirm various types of operation status:</p> <ol style="list-style-type: none"> 1] DIP switch (basic unit) This specifies the CPU communication function setting and operation mode, etc. (except for 10-point type) 2] RUN switch (basic unit) It can instruct to run and stop. (external input for 10-point type) 3] LED display (basic unit and expansion unit) Indicates the power system status, operating status and I/O operation status. 4] Communication connector (basic unit) This can connect external devices using RS-232C, RS-485, RS-422. (only the 23-point and 28-point types with RS-485, RS-422) 5] Expansion connector (basic unit and expansion unit) This allows installation of additional input/output. (except for 10-point type) 6] Terminal block (basic unit and expansion unit) This performs the connections for supplying power, and for handling signals with the control object.
3	Number of I/O points	<p>The number of points that can be controlled with respect to the control object is as follows:</p> <ol style="list-style-type: none"> 1] External inputs/outputs The number of points that can be use for external inputs/outputs differs depending on the basic unit. The 10-point type cannot expand the inputs/outputs. For the 14-point, 23-point and 28-point types, a maximum of 4 expansion units can be connected. The I/O numbers for inputs are indicated by X, WX, DX and outputs are indicated by Y, WY, DY. 2] Internal outputs These are areas for temporarily storing information. The I/O numbers include M, WM, DM, R, WR, DR. 3] A timer counter is provided internally. 4] Array (corresponding to a substitution statement only) An array of I/O numbers can be expressed by enclosing by parentheses.
4	User program memory	<p>The program in which the control contents have been described can be stored. This FLASH memory resides in the basic unit.</p> <ol style="list-style-type: none"> 1] The contents of this memory will be maintained even if the power is shut off. Because of this, it is necessary to initialize the memory since it may have undefined after the unit is purchased. 2] Programming is done using peripheral units such as programming software (LADDER EDITOR) for the H-series programmable controllers. 3] The instructions that can be used are those designated by the H-series ladder. See the list of instructions for details. 4] A battery is not required to retain the contents of the user program. Always save the created programs to a floppy disk just in case an unexpected problem occurs.

No.	Item	Description
5	Control method	<p>With the PLC, the user programs are converted in batch at operation startup, and the programs after conversion will be executed in order as they are read one by one.</p> <ol style="list-style-type: none"> 1] The method used for data I/O is that after the I/O data (information) is scanned (execution from the head of the program to the end), it is updated in group. If refresh of external I/O is required during scanning (refresh method), use the refresh instruction. 2] Apart from the program that will be normally executed, a periodic scan program which interrupts the normal program at a fixed time intervals and is executed, can be created. The time intervals are 10 ms, 20 ms and 40 ms. 3] The user programs are executed from the head of the program to the end, and are once again repeated after performing the system processing that updates the lapsed timer value, refreshes I/O, and performs communication with peripheral units.
6	Run/stop control	<p>Running and stopping the PLC is normally performed by the user.</p> <ol style="list-style-type: none"> 1] Turn on the RUN switch to start operation for the 14-point type or higher. Turn this switch off to stop operation. For the 10-point type, turn on the RUN input terminal to start operation. Turn it off to stop operation. 2] The start and stop operations can be performed with designated external inputs or internal outputs by designating the operation control inputs with a programming unit. 3] Apart from the operation described above, if a malfunction is detected in the system while it is running, operation stops and the outputs are aborted (OFF). 4] If the power is shut off and then turned back on while the system is running, operation starts. When the power shuts off, turn off the power to the PLC, then shut off the external input power. When turning the power back on, turn on the external input power before turning on the power to the PLC. 5] When starting operation, do so after clearing internal information which is not designated for storage during power failure. When stopping operation, leave the internal information as is, turn off the outputs and then stop the operation. 6] When the power has been cut off for longer than the time allowed for the momentary power failure, then depending on the system load status, either operation continues or the system perceives that a power shut off has occurred and restarts operation. To resume operation securely, have the power remain off for 1 minute or longer.
7	Operation parameters	<p>Each type of condition for operating the PLC can be set. The possible settings for operation when an error occurs are provided below.</p> <ol style="list-style-type: none"> 1] Operation may be continued when I/O information does not match. 2] Overload check time can be set. The initial value is 100 ms and the module stops when the time for one scan takes longer than the set overload check time. (overload error) 3] Operation may be continued when an overload error occurs. 4] When a power failure (power shutoff) occurs, the internal output area for retaining information and the timer counter range can be designated. <p>And, the setting below is possible.</p> <ol style="list-style-type: none"> 1] The name of the user program can be registered. 2] A password can be set up so that the third party cannot reference the program. 3] It is necessary to register the type of I/O module used as an I/O assignment table. In order to create this I/O assignment table, the types of I/O modules that are connected can be read.
8	Change while in operation	<p>A part of a program can be modified during operation.</p> <ol style="list-style-type: none"> 1] If a modification is made with a programming unit and a change is performed while in operation, the user program in the CPU is changed and the altered program is switched internally at the end of scanning, and operation continues with the new program. 2] When a control instruction is included in the modification to the program, make the changes after first performing the control instruction change procedure in the programming unit to check for safety. 3] Until operation starts to continue with the new program, a pause [halt period] occurs when the module does not run. External input information is not being received during this time, so leave a sufficient time for executing a change while in operation.

No.	Item	Description
9	Forced set/reset	Forced set and forced reset of the designated I/O can be performed from the programming unit connected to the CPU module.
10	Forced output	Output can be forced with respect to the designated I/O number from the programming unit connected to the CPU module. For I/O that is not designated, outputs are shut off.
11	Calendar clock function (only for 23- and 28-point types)	23-point and 28-point types have the calendar clock function. 1] The year, month, date, day of the week, hour, minute and second can be set. 2] There is a function for making adjustments in 30-second units. 3] When a battery is not installed, the calendar clock information is not retained when power goes off. The calendar clock must be reset. (The battery is an optional. Purchase separately.)
12	Dedicated port	This is a communication port with dedicated protocol for the H-series. The communication command called the task code is defined in the port. 1] A programming unit can be connected. (However, the command language programmer PGM-CHH and the portable graph programmer PGM-GPH cannot be used.) 2] Port 1 and port 2 can be used as dedicated ports. Transmission speed, etc. can be switched using the DIP switch. (Port 2 is supported only by the 23-point and 28-point type models.)
13	General purpose port	General purpose port function is supported from software version H0130 (WRF051=H0130) or newer. This function enables serial communication to any standard devices like bar code reader by using TRNS/RECV command in user program.
14	Modem control	A modem can be used to connect externally. It becomes operable when data receives from the external media, and task code communication can afterward be performed. Port 1 can be assigned for this function by switching the DIP switch. (The 10-point type is not supported.)
15	Self-diagnosis	Self-diagnostic tests for the following items are performed: 1] Microcomputer check 2] System program area check 3] Memory check 4] User program check 5] Internal output area check 6] Mounted I/O check
16	Abnormal handling	When a problem occurs, the error code that indicates the error description is output to special internal output WRF000 as a hexadecimal value. Also, errors are notified to the external devices through the OK LED. If the error level is high, the CPU stops operation, but depending on the error, the operation may be continued using the user settings. If multiple errors occur, the error code with higher error severity is set. The detailed information is also set to the special internal output. Also, this information is always recorded in the power failure memory, so the information can be referenced even after the power is cut off. (However, a battery is required.) The clearing of the error information can be conducted by turning on R7EC.
17	Task code	By combining individual task codes, the following functions can be achieved by the programs in the host computer: 1] CPU control (RUN/STOP control of CPU, occupy/release, CPU status read, etc.) 2] I/O control (various types of monitoring) 3] Memory write (all clear, batch transfer, etc.) 4] Memory read (reading of programs, etc.) 5] Response (various responses from CPU)
18	Instruction	Programming can be performed for various purposes and usage by combining Ladder and the instruction language.
19	High-speed counter	The external input of the basic unit can be used as a high-speed counter by specifying it as a counter input. The following can be set. 1] Single-phase counter, 2 channels 2] Single-phase counter, 4 channels (For the 10-point type, it is single-phase, 3 channels.) 3] Two-phase counter 1 channel, single-phase counter 1 channel (For the 10-point type, it is two-phase, 1 channel.) The functions include a count operation (up/down, leading/trailing), coincidence output control, preset by preloaded input, and count value reading by strobe input.

No.	Item	Description
20	Interrupt input	The external input of the basic unit can be specified for interrupt input. With the interrupt input, the corresponding interrupt program can be executed.
21	PWM output	The external output of the basic unit can be specified for pulse width modulated output. In this case, pulses are output at the specified frequency with a duty between 0 and 100 %. A maximum of 4 points, including the pulse array output, can be set.
22	Pulse train output	The external output of the basic unit can be specified for pulse output. In this case, pulses are output at the specified frequency with a duty between 30 and 70 %. A maximum of four points, including the pulse output, can be set.
23	Analogue input	The analogue input function is available in the 23-point type and analog exp. unit. The resolution is 12 bits and it can be used by either selecting a current input between 0 and 20 mA or a voltage input between 0 and 10 V.
24	Analogue output	The analogue output function is available in the 23-point type and analog exp. unit. The resolution is 12 bits and it can be used by either selecting a current output between 0 and 20 mA or a voltage output between 0 and 10 V.
25	Potentiometer	14-point, 23-point, and 28-point types have two potentiometers, with which setting values etc. can be changed without using the programming units.
26	Battery	A dedicated battery can be installed in the 23-point and 28-point types so that data in the data memory can be maintained even when the power supply to the main unit is shut off. In addition, the data of the calendar clock in the 23-point and 28-points types can be maintained. The battery is an optional (model EH-MBAT). Please refer to Chapter 15 (4) Life of the battery.

Note: There are functions supported by H series that are not supported by this PLC (debug, trace, force, and simulation functions).

3.3 Performance Specifications

3.3.1 Calculation Specifications

The calculation specifications of the PLC are described below.

Model	Name		10-point type	14-point type	23/28-point type		
	Type		EH-D10DT EH-D10DTP EH-D10DR	EH-D14DT EH-D14DTP EH-A14DR EH-D14DR EH-A14AS	EH-A23DRP EH-A23DRT EH-D23DRP	EH-D28DT EH-D28DTP EH-A28DRP EH-A28DRT EH-A28DR EH-D28DRP EH-D28DRT EH-D28DR EH-A28AS	
Control specifications	CPU		32-bit RISC processor				
	Processing system		Stored program cyclic system				
	Processing speed	Basic instructions	0.9 μs / instruction				
		Application instructions	Several 10 μs / instruction				
	User program memory		3 k steps max. (FLASH memory)				
Operation processing specifications	Instruction language	Basic instructions	39 types such as LD, LDI, AND, ANI, OR, ORI, ANB, ORB, OUT, MPS, MRD, MPP, etc.				
		Arithmetic instructions Application instructions	62 types (arithmetic, application, control, FUN command etc.)				
	Ladder	Basic instructions	39 types, such as 				
		Arithmetic instructions Application instructions	62 types (arithmetic, application, control, FUN command etc.)				
I/O processing specifications	External I/O	I/O processing system		Refresh processing			
		Maximum number of points		10 points	126 points	135 points	140 points
	Internal output	Bit		1,984 points (R0 to R7BF)			
		Word		4,096 words (WR0 to WRFFF)			
		Special	Bit	64 points (R7C0 to R7FF)			
			Word	512 words (WRF000 to WRF1FF)			
		Bit/word shared		16,384 points, 1,024 words (M0 to M3FFF, WM0 to WM3FF)			
	Timer counter	Number of points		256 points (TD + CU) *1			
		Timer set value		0 to 65,535, timer base 0.01 s, 0.1 s, 1 s (0.01s has maximum 64 points *2)			
		Counter set value		1 to 65,535 times			
	Edge detection		512 points (DIF0 to DIF511: Decimal) + 512 points (DFN0 to DFN511: Decimal)				
	Peripheral equipment	Program system		Instruction language, ladder diagram			
Peripheral unit		Programming software (LADDER EDITOR DOS version/Windows® version, Pro-H) Instruction language programmer and form graphic display programmer cannot be used.					
Maintenance functions	Self-diagnosis		PLC error (LED display): Microcomputer error, watchdog timer error, memory error, program error, system ROM/RAM error, scan time monitoring, battery voltage low detection, etc.				

*1: The same numbers cannot be used with the timer counter.

*2: Only timers numbered 0 to 63 can use 0.01 s for their timer base.

3.3.2 Input Specifications

The input circuit consists of DC input and AC input, with the following specifications.

(1) DC input

Item		Specification	Circuit diagram
Input voltage		24 V DC	
Allowable input voltage range		0 to 30 V DC	
Input impedance		Approx. 2.8 kΩ	
Input current		7.5 mA typical	
Operating voltage	ON voltage	15 V DC (min) / 4.5 mA (max)	
	OFF voltage	5 V DC (max) / 1.5 mA (max)	
Input lag	OFF → ON	Basic unit : 0.5 to 20 ms (configurable)	
		Exp. unit : 0.5 ms or less	
	ON → OFF	Basic unit : 0.5 to 20 ms (configurable)	
		Exp. unit : 0.5 ms or less	
Number of input points		See Chapter 4	
Number of common		See Chapter 4	
Polarity		None	
Insulation system		Photocoupler insulation	
Input display		LED (green)	
External connection		10-point type: fixed type terminal block 14-, 23-, 28-point types: Removable type screw terminal block (M3)	

The circuit diagram illustrates the input terminal block's internal structure. It features a 24V DC power source connected to terminals 0 and 1. Terminal 0 is linked to a common terminal C. Terminal 1 is connected to a resistor and a capacitor. The common terminal C is also connected to a resistor and a capacitor. The output of the photocoupler is connected to terminal C. The internal circuit is depicted within a dashed rectangular boundary.

*1: Common terminals are separated each other.

(2) AC input

Item		Specification	Circuit diagram
Input voltage		100 to 120 V AC	
Allowable input voltage range		85 to 132 V AC 50 -5 % to 60 +5 % Hz	
Input impedance		Approx. 14.6 k Ω (60 Hz) Approx. 17.6 k Ω (50 Hz)	
Input current		Approx. 7 mA RMS (100 V AC/60 Hz)	
Operating voltage	ON voltage	80 V AC (min.) 4.5 mA	
	OFF voltage	30 V AC (max.) 2 mA	
Input lag	OFF \rightarrow ON	25 ms (max.) *1	
	ON \rightarrow OFF	30 ms (max.) *1	
Number of input points		See Chapter 4.	
Number of common		See Chapter 4.	
Polarity		None	
Insulation system		Photocoupler insulation	
Input display		LED (green)	
External connection		14-, 28-point types: Removable type screw terminal block (M3)	

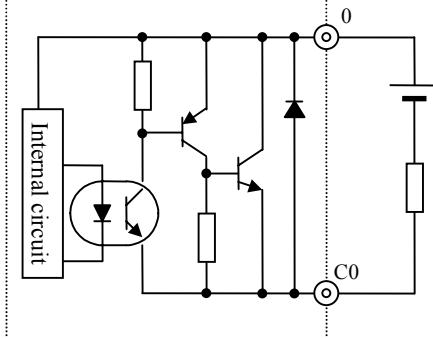

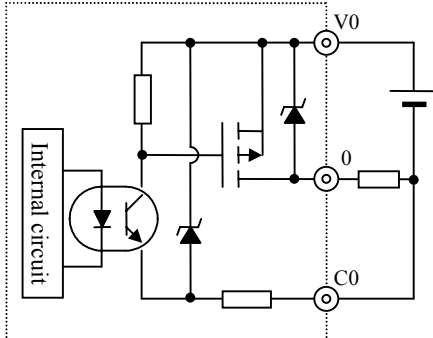

*1: Delay by hardware only. Delay by digital filter (software filter) 0.5 to 20 ms is not included.

*2: Common terminals are separated each other.

3.3.3 Output Specifications

(1) DC output

(Y100 of EH-*23DRP/A23DRT/*28DRP/*28DRT)

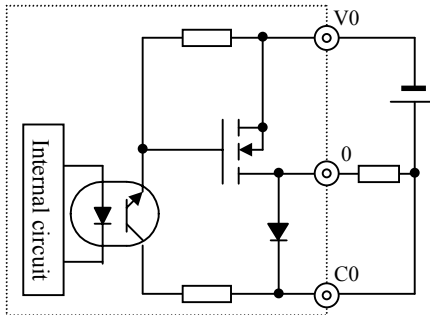

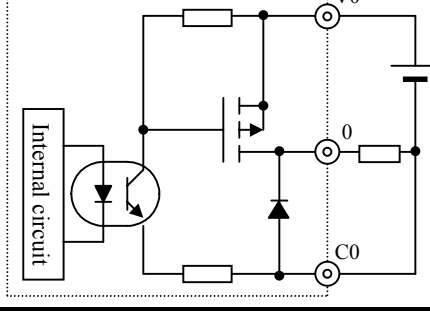

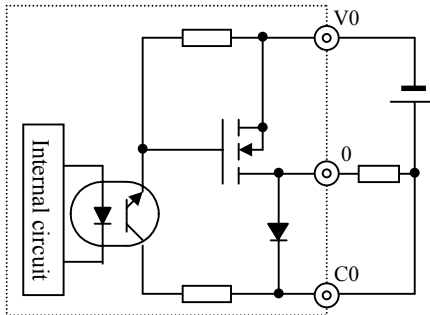

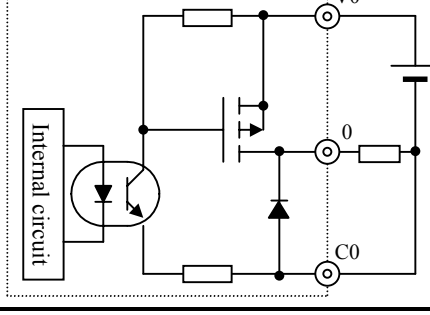

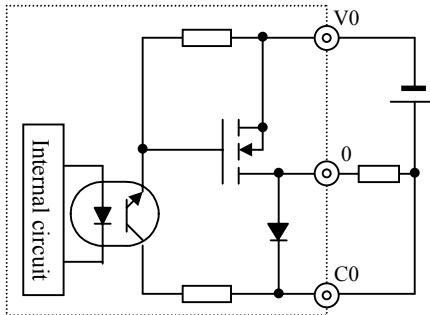

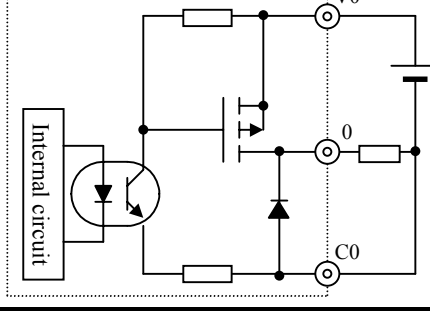

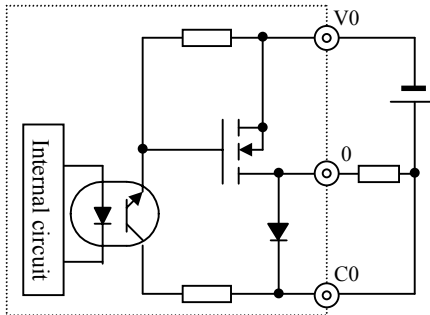

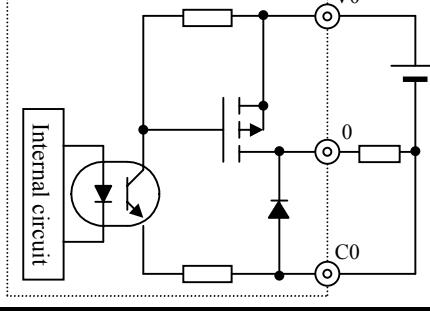

Item		Specification		Circuit diagram
Type		EH-A23DRT EH-*28DRT	EH-*23DRP EH-*28DRP	Sink type (23/28DRT) 
Y100 output specifications		Transistor output (sink type)	Transistor output (source type)	
Rated load voltage		24 / 12 / 5 V DC 24 V DC +20 %, -80 %		Source type (23/28DRP) 
Minimum switching current		1 mA		
Leak current		0.1 mA (max)		
Maximum load current	1 circuit	0.75 A 24 V DC 0.5 A 12 V DC 0.25 A 5 V DC		
	1 common	0.75 A		
Output response time	OFF → ON	0.1 ms (max) 24 V DC 0.2 A		
	ON → OFF	0.1 ms (max) 24 V DC 0.2 A		
Number of output points		1		
Number of common		1		
Surge removing circuit		None		
Fuse		None		
Insulation system		Photocoupler insulation		
Output display		LED (green)		
External connection		Removable type screw terminal block (M3)		
External power supply *1 to V terminal		Not necessary	30 to 16 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)		
Output voltage drop		0.3 V DC (max)		

*1: It is necessary to supply 16 to 30 V DC between the V and C terminals externally for the source type.

The sink type operates by load power supply only. See "4.6 Terminal Layout and Wiring" for the details.

(2) DC output: LCDC-Low Current

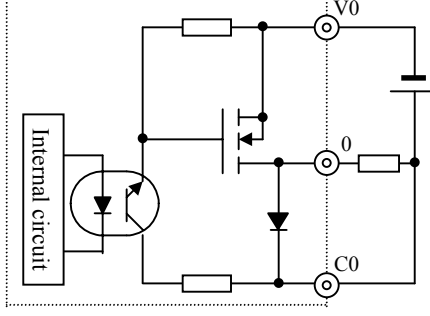

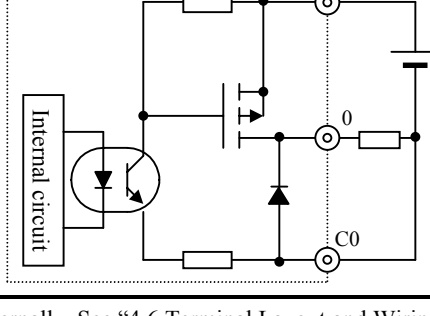

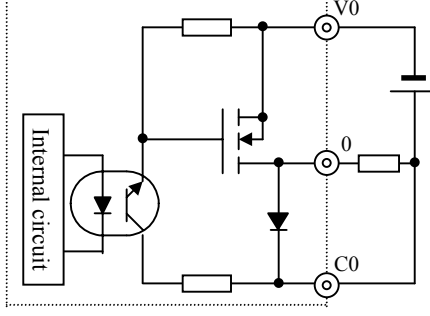

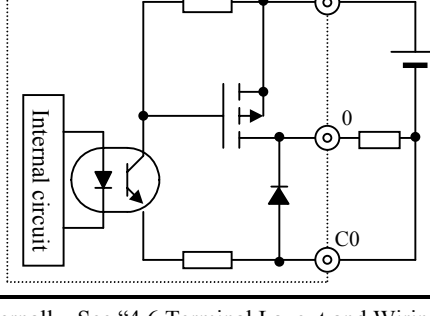

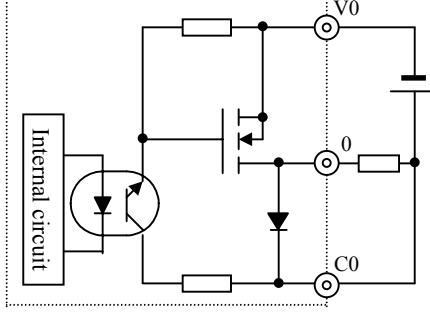

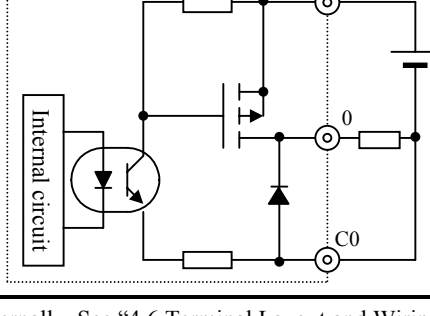

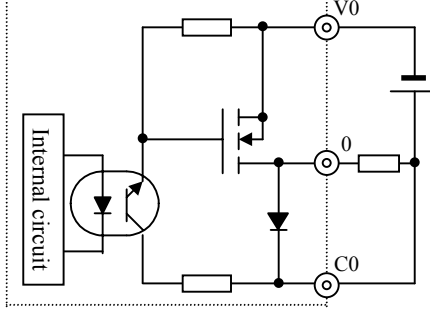

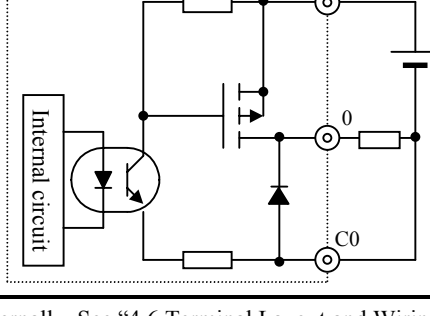

(All points of EH-D10DT/DTP, **Y102-Y105** of EH-D14DT/DTP, **Y102-Y109** of EH-D28DT/DTP, **Y*018-Y*021** of EH-D14EDT/D14EDTP)

Item		Specification	Circuit diagram
Output specification		Transistor output	Sink type (EH-D**DT)
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		1 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	0.75 A 24 V DC	
	1 common	0.5 A 12 V DC	
Output response time	OFF → ON	0.1 ms (max) 24 V DC 0.2A	
	ON → OFF	0.1 ms (max) 24 V DC 0.2A	
Number of output points		See Chapter 4.	
Number of common		See Chapter 4.	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *1		30 to 12 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: It is necessary to supply 12 to 30 V DC between the V and C terminals externally. See “4.6 Terminal Layout and Wiring.”

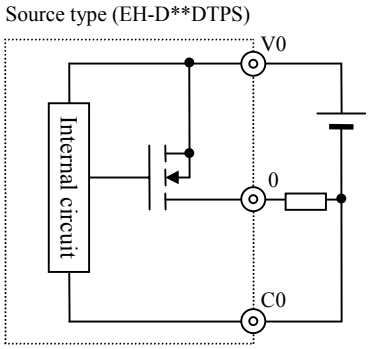

(3) DC output: HCDC-High Current

(**Y100,Y101** of EH-D14DT/DTP, **Y100, Y101, Y110, and Y111** of EH-D28DT/DTP, **Y*016, Y*017** of EH-D14EDT/D14EDTP)

Item		Specification	Circuit diagram
Output specification		Transistor output	Sink type (EH-D**DT)
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		1 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	1A 24 V DC	
	1 common	3 A	
Output response time	OFF → ON	0.1 ms (max) 24 V DC 0.2A	
	ON → OFF	0.1 ms (max) 24 V DC 0.2A	
Number of output points		See Chapter 4.	
Number of common		See Chapter 4.	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *1		30 to 12 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

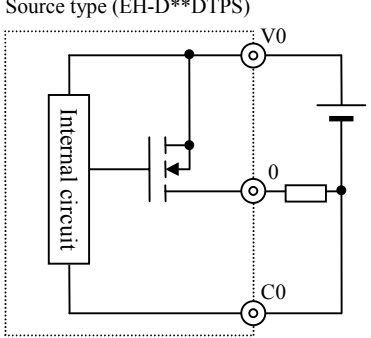

*1: It is necessary to supply 12 to 30 V DC between the V and C terminals externally. See “4.6 Terminal Layout and Wiring.”

(4) DC output (ESCP type): HCDP-High Current
 (Y100,Y101 of EH-D14DTPS, Y100-Y103 of D28DTPS)
 Y*016,Y*017 of EH-EDTPS, Y*016-Y*019 of EH-D28EDTPS)

Item		Specification	Circuit diagram
Output specification		Transistor output	
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		10 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	1 A	
	1 common	3 A	
Output response time	OFF → ON	0.05 ms (max) 24 V DC 0.2A	
	ON → OFF	0.05 ms (max) 24 V DC 0.2A	
Number of output points		See Chapter 4.	
Number of common		See Chapter 4.	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *1		30 to 12 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: It is necessary to supply 12 to 30 V DC between the V and C terminals externally. See “4.6 Terminal Layout and Wiring.”

(5) DC output (ESCP type): LCDP-Low Current
 (Y102-Y105 of EH-D14DTPS, Y104-Y111 of EH-D28DTPS)
 Y*018-Y*021 of EH-D14EDTPS, Y*020-Y*027 of EH-D28EDTPS)

Item		Specification	Circuit diagram
Output specification		Transistor output	
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		10 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	0.7 A	
	1 common	3 A	
Output response time	OFF → ON	0.5 ms (max) 24 V DC 0.2A	
	ON → OFF	0.5 ms (max) 24 V DC 0.2A	
Number of output points		See Chapter 4.	
Number of common		See Chapter 4.	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *1		30 to 12 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: It is necessary to supply 12 to 30 V DC between the V and C terminals externally. See “4.6 Terminal Layout and Wiring.”

(6) Relay output

Item		Specification	Circuit diagram
Rated load voltage		5 to 250 V AC, 5 to 30 V DC	
Minimum switching current		1 mA	
Maximum load current	1 circuit	2 A (24 V DC, 240 V AC)	
	1 common	5 A	
Output response time	OFF → ON	15 ms (max)	
	ON → OFF	15 ms (max)	
Number of output points		See Chapter 4.	
Number of common		See Chapter 4.	
Surge removing circuit		None	
Fuse		None	
Insulation system		Relay insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power (for driving the relays)		Not necessary	
Contact life *1		20,000,000 times (mechanical) 200,000 times (electrical: 2 A)	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	

*1: Refer to the Life curve of relay contacts in Chapter 10 for the details.

(7) AC output (SSR)

Item		Specification	Circuit diagram
Output specification		Triac output	
Rated voltage		100/240 V AC	
Output voltage		100 -15 % to 240 +10 % V AC 50 -5 % to 60 +5 % Hz	
Maximum load current	1 circuit	0.5 A 240 V AC	
	1 common	2 A	
Minimum load current		100 mA	
Maximum leakage current		1.8 mA 115 V AC(max) 3.5 mA 230 V AC(max)	
Maximum inrush current		5 A (at 1 cycle or less)/point 10 A (at 1 cycle or less)/common	
Maximum delay time	Off → On	1 ms or less	
	On → Off	1 ms + 1/2 cycle or less	
Output common		See Chapter 4.	
Polarity		See Chapter 4.	
Insulation system		Phototriac insulation	
Fuse *2		Used	
Surge removing circuit		Sunabar circuit + varistor	
External connection		Removable terminal block	
Voltage drop		1.5 V RMS (max)	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	

*2: It is necessary to repair the module if the load short-circuits and causes the fuse to melt.
Note that the fuse cannot be replaced by users.

3.3.4 High-Speed Counter Specifications

		Single phase	Two phase
Available input		X0, X2, X4, X6	X0 and X2 in pair
Input voltage	ON	15 V	
	OFF	5 V	
Count pulse width		100 μ s	
Maximum count frequency		10 kHz each channel	
Count register		16 bits	
Coincidence output		Allowed	
On/Off-preset		Allowed	
Upper/lower limit setting		Not allowed	
Preload/strobe		Allowed	

Since 10 points type does not have input X6, counter channel is up to 3 ch.

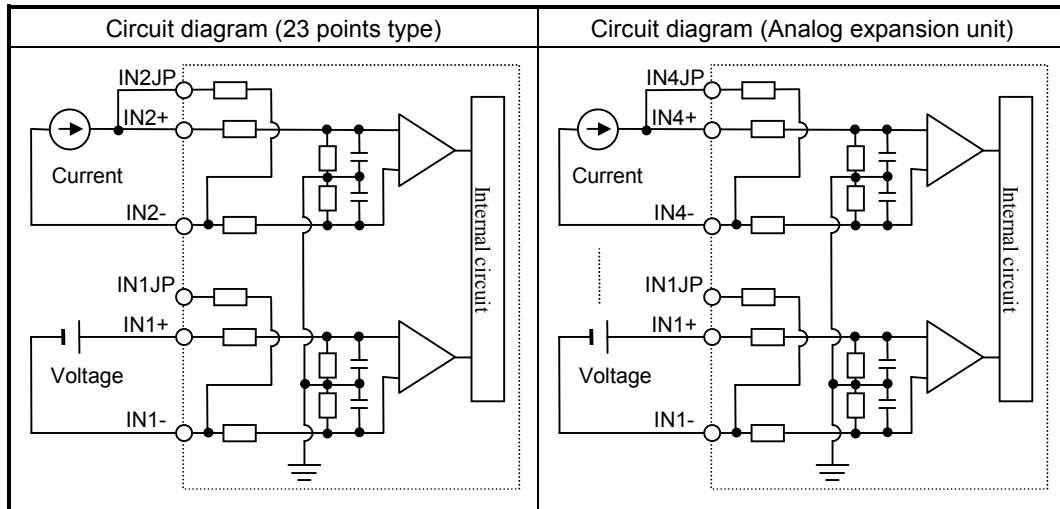

3.3.5 PWM Output/Pulse Train Output Specifications

	23-point and 28-point type Relay Output	10/14/28-point Transistor Output
Available outputs	Y100 (optional)	Y100-Y103 (optional)
Load voltage	5/12/24 V	12/24 V
Minimum load current	1 mA	
PWM max. output frequency *1	2 kHz total channels	
Pulse train max. output frequency *1	5 kHz total channels	
Pulse acceleration/deceleration	By FUN 151.	

*1: Relay outputs cannot keep up with high frequencies; these outputs should be used at the operating frequency upon confirmation.

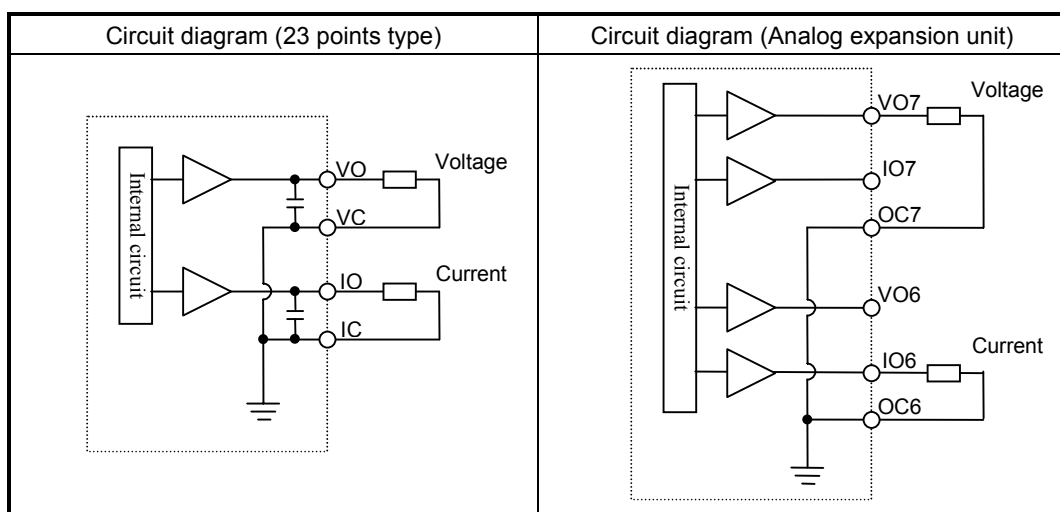

3.3.6 Analogue Input Specifications

Module type	23 points module	Analogue exp. unit
Input channel	WX30, WX31	WX u01 - WX u04 (u : unit number)
Input range	0-10 V (10.24V max.)	0-10V (10.24V max.)
		-10 to +10V (\pm 10.24V max.)
	0-20 mA (20.48 mA max.)	0-20 mA (20.48 mA max.)
	-	4-20 mA (20.38 mA max.)
Resolution	12 bits	
Accuracy	\pm 1 % of full scale	
Linearity	Max. \pm 3 units	
Current input impedance	Approx. 249 Ω	
Voltage input impedance	Approx. 100 k Ω	Approx. 200 k Ω
Input delay time	20 ms	
Channel to internal circuit insulation	Not insulated	Insulated
Channel-to-channel insulation	Not insulated	

3.3.7 Analogue Output Specifications

Module type	23 points type module	Analog exp. unit
Output channel	WY40	WY u06, WY u07 (u : unit number)
Output range	0-10V (10.24V max.)	0-10V (10.24V max.)
	0-20mA (20.48mA max.)	0-20mA (20.48mA max.)
		4-20mA (20.38mA max.)
Resolution	12 bits	
Accuracy	± 1 % of full scale	
Current output	10 to 500 Ω Maximum 2000 pF Maximum 1 H	
Allowable load		
Output allowable capacity		
Output allowable inductance		
Voltage output	Maximum 10 k Ω Maximum 1 μ F	
Allowable load		
Output allowable impedance		

3.3.8 Potentiometer Analogue Input Specifications

Number of potentiometer inputs	2
Stored in	Ch.1 : WRF03E, Ch.2 WRF03F
Input range	0-1023 (H0-H3FF)
Resolution	10 bits
Input filter	By user settings

3.3.9 Interrupt Input Specifications

Input that can be used	X1, X3, X5, X7 (by user settings)	
Input voltage	ON	15 V
	OFF	5 V

3.3.10 Backup

(1) Battery

Data memory (retentive area) can be kept by EH-MBAT battery as below.

Battery life time (total power off time) [Hr] *	
Guaranteed value (Min.) @55°C	Actual value (Max.) @25°C
9,000	18,000

* Battery life time has been changed since Oct. 2002 production (MFG NO.02Jxx) due to hardware modification.

Battery can be mounted inside of front cover.

Battery is available only for 23-point and 28-point types.

If the calendar clock function is used with the 23-point or 28-point type, be sure to use the battery.

(2) Capacitor

14-point type: Data can be kept for 72 hours (at 25 °C) by the capacitor.

23 and 28-point types: Data can be kept for 24 hours (at 25 °C) by the capacitor.

Please note that data memory of 10 point type cannot be retained.

3.3.11 Expansion

- Up to 4 times of expansion units can be installed.
- 14 points and 28 points digital units, and 4ch. input / 2 ch. output analog expansion units available.
- A cable with a length of up to 1 m can be used to connect between units.
- The total extension cable length can be up to 2 m (from the basic unit to the expansion unit at the end).
- The 10-point type unit cannot be expanded.

3.3.12 Clock Function

23-point and 28-point types have calendar function. This can be operated either by internal output area or task code.

* 10-point and 14-point types do not have this function.

(1) Reading the clock data

By turning on the read request (R7F8), the clock data is read out in the reading value area (WRF01B to WRF01F).

(2) Writing the clock data

By turning on the write request (R7F9), the clock data stored in writing value area (WRF01B to WRF01F) is written to the current data area (WRF00B to WRF00F). If the data is wrong, error flag (R7BF) will turn on. If data is right, clock data will be written and writing flag R7FB will turn off.

(3) Adjusting the clock data ± 30 seconds

By turning on the ± 30 seconds adjustment request (R7FA), one of the following operations is performed depending on the second value:

- If the second digits are 00 to 29, the second digits are set to 00.
- If the second digits are 30 to 59, the minute is incremented by 1 and the second digits are set to 00.

(4) Special internal output definitions

- Operation bits

I/O number	Name	Description
R7F8	Request to read calendar and clock data	Calendar and clock data is read out to WRF01B-F01F.
R7F9	Request to write calendar and clock data	Calendar and clock data in WRF01B-F01F is written to the current data in WRF00B-F00F.
R7FA	Clock ± 30 seconds adjustment request	Sets the second digits of the RTC to 00.
R7FB	Calendar and clock setting data error	Turns on when the setting data is abnormal.

- Current data monitor area : Current data of the clock given always (all BCD data).

I/O number	Name	Description
WRF00B	Year	4-digit year [yyyy]
WRF00C	Month and date	[mmdd]
WRF00D	Day of the week	0 to 6 : Sunday to Saturday
WRF00E	Hour and minute	[hhmm] (24-hour system).
WRF00F	Second	[00ss]

- Reading/writing area : Clock data to be read or written.
(All BCD data)

I/O number	Name	Description
WRF01B	Year	4-digit year [yyyy]
WRF01C	Month and date	[mmdd]
WRF01D	Day of the week	0 to 6 : Sunday to Saturday
WRF01E	Hour and minute	[hhmm] (24-hour system).
WRF01F	Second	[00ss]

Note 1: The day of the week data is expressed as follows.

0: Sunday, 1: Monday, 2: Tuesday, 3: Wednesday, 4: Thursday, 5: Friday, 6: Saturday

3.3.13 Power Supply for Sensor

The 24 V terminal at the input terminal part can supply current to external equipment (not for all units).

If this terminal is used as the power supply for the input part of this unit, the remaining can be used as power supply for the sensors.

The following current (I) can be supplied as power supply for the sensors.

- (1) EH-*14*** (14-point type basic unit)
EH-*14E*** (14-point type extension unit)

$$I = 350 \text{ mA} - (7.5 \text{ mA} \times \text{number of input points that are turned on at the same time})$$

- (2) EH-A28DR* (28-point type basic unit)
EH-A23DR*** (23-point type basic unit)

$$I = 280 \text{ mA} - (7.5 \text{ mA} \times \text{number of input points that are turned on at the same time})$$

Chapter 4 Product lineup and wiring

4.1 Product lineup

(1) Basic units

Table 4.1 Product lineup list

Type	Specifications	I/O assignment symbol
EH-D10DT	DC power, DC input × 6, Transistor (sink) output × 4	X48/Y32/empty16
EH-D10DTP	DC power, DC input × 6, Transistor (source) output × 4	X48/Y32/empty16
EH-D10DR	DC power, DC input × 6, Relay output × 4	X48/Y32/empty16
EH-D14DT	DC power, DC input × 8, Transistor (sink) output × 6	X48/Y32/empty16
EH-D14DTP	DC power, DC input × 8, Transistor (source) output × 6	X48/Y32/empty16
EH-A14DR	AC power, DC input × 8, Relay output × 6	X48/Y32/empty16
EH-D14DR	DC power, DC input × 8, Relay output × 6	X48/Y32/empty16
EH-A14AS	AC power, AC input × 8, SSR output × 6	X48/Y32/empty16
EH-D23DRP	DC power, DC input × 13, Relay output × 9, Transistor output (source) × 1, Analog input × 2, Analog output × 1	X48/Y32/empty16/WX4/WY4
EH-A23DRT	AC power, DC input × 13, Relay output × 9, Transistor output (sink) × 1, Analog input × 2, Analog output × 1	X48/Y32/empty16/WX4/WY4
EH-A23DRP	AC power, DC input × 13, Relay output × 9, Transistor output (source) × 1, Analog input × 2, Analog output × 1	X48/Y32/empty16/WX4/WY4
EH-D28DT	DC power, DC input × 16, Transistor (sink) output × 12	X48/Y32/empty16
EH-D28DTP	DC power, DC input × 16, Transistor (source) output × 12	X48/Y32/empty16
EH-D28DTPS	DC power, DC input × 16, Transistor (source) output (ESCP) × 12	X48/Y32/empty16
EH-D28DRT	DC power, DC input × 16, Relay output × 11, Transistor output (sink) × 1	X48/Y32/empty16
EH-D28DRP	DC power, DC input × 16, Relay output × 11, Transistor output (source) × 1	X48/Y32/empty16
EH-A28DRT	AC power, DC input × 16, Relay output × 11, Transistor output (sink) × 1	X48/Y32/empty16
EH-A28DRP	AC power, DC input × 16, Relay output × 11, Transistor output (source) × 1	X48/Y32/empty16
EH-A28DR	AC power, DC input × 16, Relay output × 12	X48/Y32/empty16
EH-A28AS	AC power, AC input × 16, SSR output × 12	X48/Y32/empty16
EH-D14EDT	Expansion unit, DC power, DC input × 8, Transistor (sink) output × 6	B1/1
EH-D14EDTP	Expansion unit, DC power, DC input × 8, Transistor (source) output × 6	B1/1
EH-D14EDTPS	Expansion unit, DC power, DC input × 8, Transistor (source) output (ESCP) × 6	B1/1
EH-D14EDR	Expansion unit, DC power, DC input × 8, Relay output × 6	B1/1
EH-A14EDR	Expansion unit, AC power, DC input × 8, Relay output × 6	B1/1
EH-D28EDT	Expansion unit, DC power, DC input × 16, Transistor (sink) output × 12	B1/1
EH-D28EDTPS	Expansion unit, DC power, DC input × 16, Transistor (source) output (ESCP) × 12	B1/1
EH-D28EDR	Expansion unit, DC power, DC input × 16, Relay output × 12	B1/1
EH-A28EDR	Expansion unit, AC power, DC input × 16, Relay output × 12	B1/1
EH-D6EAN	Expansion unit, DC power, Analog input × 4, Analog output × 2	FUN 0
EH-A6EAN	Expansion unit, AC power, Analog input × 4, Analog output × 2	FUN 0

Each digit in the type name has the following meaning:

(2) Peripheral Units

Table 4.2 List of peripheral units

Product	Form	Specification	Remarks
Graphic input device support software	HL-GPCL	Ladder diagram/Instruction language editor LADDER EDITOR (for GPCL)	
	HL-PC3	Ladder diagram/Instruction language editor LADDER EDITOR (for PC98 series) with CPU connection cable	
	HL-AT3E	Ladder diagram/Instruction language editor LADDER EDITOR (for PC/AT compatible personal computer)	
	HLW-PC3	Ladder diagram/Instruction language editor LADDER EDITOR (for Windows® 95/NT 4.0)	
	HLW-PC3E	Ladder diagram/Instruction language editor LADDER EDITOR (for Windows® 95/98/NT 4.0)	
	Pro-H	HITACHI H-series PLC Programming Software According to IEC 61131-3 (for Windows® 95/98/NT 4.0)	

Note: HI-LADDER (attached to the GPCL01H) may also be used.

However, HL-GPCL and HI-LADDER cannot be used for the 10-point type.

(3) Connection Cables

Table 4.3 List of connection cables

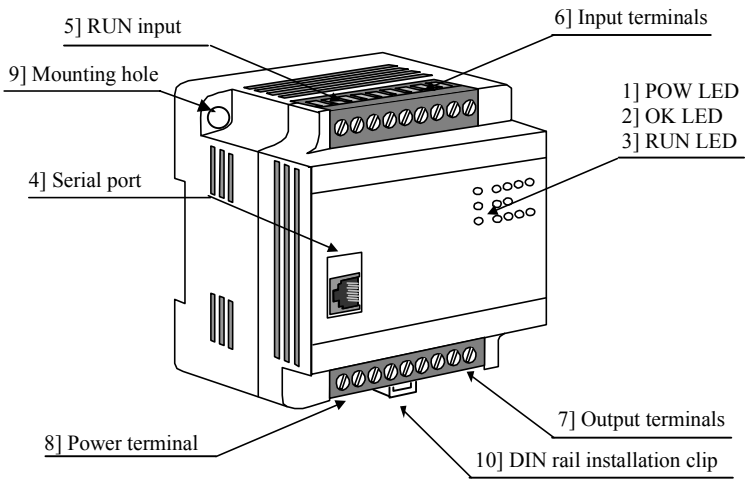

Product	Form	Specification	Remarks
Cable for connecting basic unit and expansion unit	EH-MCB10	Length: 1 m (basic unit-exp. unit, exp. unit - exp. unit)	Total 2 m
	EH-MCB05	Length: 0.5 m (basic unit-exp. unit, exp. unit - exp. unit)	Total 2 m
	EH-MCB01	Length: 0.1 m (basic unit-exp. unit, exp. unit - exp. unit)	Total 2 m
Conversion cable for connecting peripheral units	EH-RS05	Length: 0.5 m	*
Peripheral equipment	GPCB02H	Length: 2 m, between CPU and graphic input unit	
	GPCB05H	Length: 5 m, between CPU and graphic input unit	
	GPCB15H	Length: 15 m, between CPU and graphic input unit	
	CBPGB	Length: 2 m, between graphic input unit and printer	
	LP100	Length: 2 m, between graphic input unit and kanji printer	
	KBADPTH	Length: 15 m, between graphic input unit and JIS keyboard	
	PCCB02H	Length: 2 m, between CPU and PC98 series	**
	WPCB02H	Length: 2 m, between CPU and PC98 series (25-pin)	**
	WVCB02H	Length: 2 m, between CPU and DOS/V (9-pin)	**
	EH-VCB02	Length: 2 m, between CPU (8P modular terminal) and DOS/V (9-pin)	

*: Required when connecting the MICRO-EH with PC98, IBM PC/AT compatible PC or other system using one of the cables marked with **.

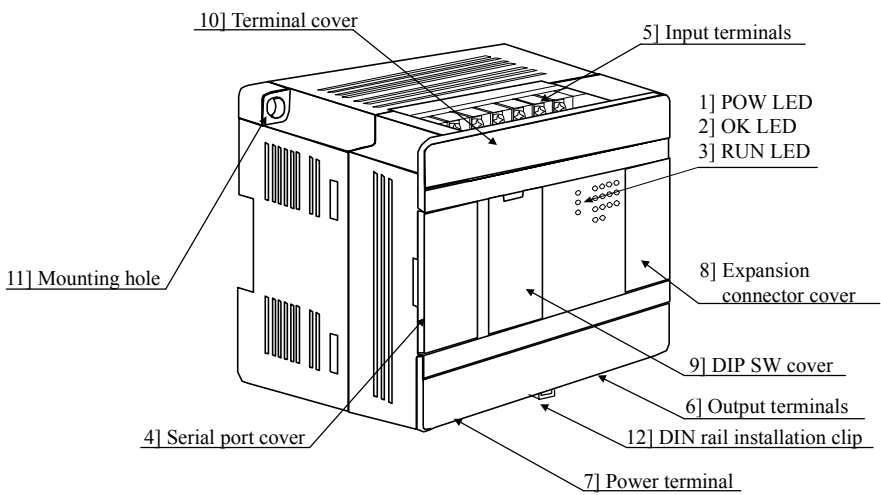

(4) Others

Model	Usage	Remarks
EH-MBAT	Lithium battery	

4.2 10-Point Basic Unit

Name and function of each part		Type	EH-D10DT, EH-D10DTP, EH-D10DR
 <p>The diagram shows a 3D perspective of the 10-Point Basic Unit. It is a rectangular device with a DIN rail clip at the bottom. Various components are labeled with numbers and arrows:</p> <ul style="list-style-type: none"> 1] POW LED: Located on the front panel, top right. 2] OK LED: Located on the front panel, top right, below the POW LED. 3] RUN LED: Located on the front panel, top right, below the OK LED. 4] Serial port: Located on the front panel, middle left. 5] RUN input: Located on the top of the unit, left side. 6] Input terminals: Located on the top of the unit, right side. 7] Output terminals: Located on the bottom of the unit, right side. 8] Power terminal: Located on the bottom of the unit, left side. 9] Mounting hole: Located on the top of the unit, left side. 10] DIN rail installation clip: Located at the bottom of the unit. 			
No.	Item	Detailed explanation	Remarks
Explanation of operation		Operations are performed according to the contents of the program created by the user. The programming unit connected to the CPU module communication port writes and reads the user programs. Memory is installed inside the CPU module in which the user programs and internal output information are stored.	
1]	POW LED	Lighting when the power is supplied.	
2]	OK LED	Lighting at normal operation.	See Chapter 12.
3]	RUN LED	Lighting at RUN status.	
4]	Serial port 1	Serial port for connecting the peripheral units. Communication speed is fixed as 4800 bps. The communication specification is set to port 1.	See Chapter 11.
5]	RUN input	External input to control the PLC's RUN/STOP. When 24 V DC is loaded to the RUN terminal and common terminal (C), the PLC is set to the RUN state.	See Chapter 10.
6]	Input terminals	Terminals for wiring the external input units. One piece of AWG14 to AWG22 (2.1 to 0.36 mm ²) or two pieces of AWG16 to AWG22 (1.3 to 0.36 mm ²) per terminal may be wired.	See Chapter 10.
7]	Output terminals	Terminals for connecting the external load. The wiring specification is the same as for the input terminals.	See Chapter 10.
8]	Power terminal	Terminal for connecting the power supply. The wiring specification is the same as for the input terminals.	See Chapter 10.
9]	Mounting hole	Used when installing the PLC directly on a board with screws	See Chapter 10.
10]	DIN rail installation clip	Used when installing the PLC on a DIN rail	See Chapter 10.

4.3 14-Point Basic Unit

Name and function of each part		Type	EH-*14***
 <p>1] POW LED 2] OK LED 3] RUN LED 4] Serial port cover 5] Input terminals 6] Output terminals 7] Power terminal 8] Expansion connector cover 9] DIP SW cover 10] Terminal cover 11] Mounting hole 12] DIN rail installation clip</p>			
No.	Item	Detailed explanation	Remarks
Explanation of operation		Operations are performed according to the contents of the program created by the user. The programming unit connected to the CPU module communication port writes and reads the user programs. Memory is installed inside the CPU module in which the user programs and internal output information are stored.	
1]	POW LED	Lighting when the power is supplied.	
2]	OK LED	Lighting at normal operation.	See Chapter 12.
3]	RUN LED	Lighting at RUN status.	
4]	Serial port cover	Cover for the connector for connecting peripheral units and the RUN switch. When the cover is opened, the RUN switch, potentiometers (VR), and RS-232C serial port 1 (PORT 1) can be used. The communication specification is set to port 1.	See Chapters 8 and 11.
5]	Input terminals	Terminals for wiring the external input units. Recommended terminals are shown in the figure to the right. One piece of AWG14 to AWG22 (2.1 to 0.36 mm ²) or two pieces of AWG16 to AWG22 (1.3 to 0.36 mm ²) per terminal may be wired.	See Chapter 10. (Make sure that the terminals will not disengage due to loose screws.) (Recommended)
6]	Output terminals	Terminals for connecting the external load. The wiring specification is the same as for the input terminals.	See Chapter 10.
7]	Power terminal	Terminal for connecting the power supply. The wiring specification is the same as for the input terminals.	See Chapter 10.
8]	Expansion cover	Cover for the expansion connector	See Chapter 10.
9]	DIP SW cover	Cover for the DIP switches When the cover is opened, the DIP switches are exposed. These DIP switches are used to set the communication speed of serial port 1 and the modem connection.	See Chapter 11.
10]	Terminal cover	Cover for terminals	
11]	Mounting hole	Used when installing the PLC with screws	See Chapter 10.
12]	DIN rail installation clip	Used when installing the PLC on a DIN rail	See Chapter 10.

4.4 23-Point and 28-Point Basic Unit

Name and function of each part		Type	EH-*23***
			EH-*28***

10] Terminal cover

4] Serial port cover

5] Input terminals

1] POW LED

2] OK LED

3] RUN LED

8] Expansion connector cover

9] DIP SW cover

6] Output terminals

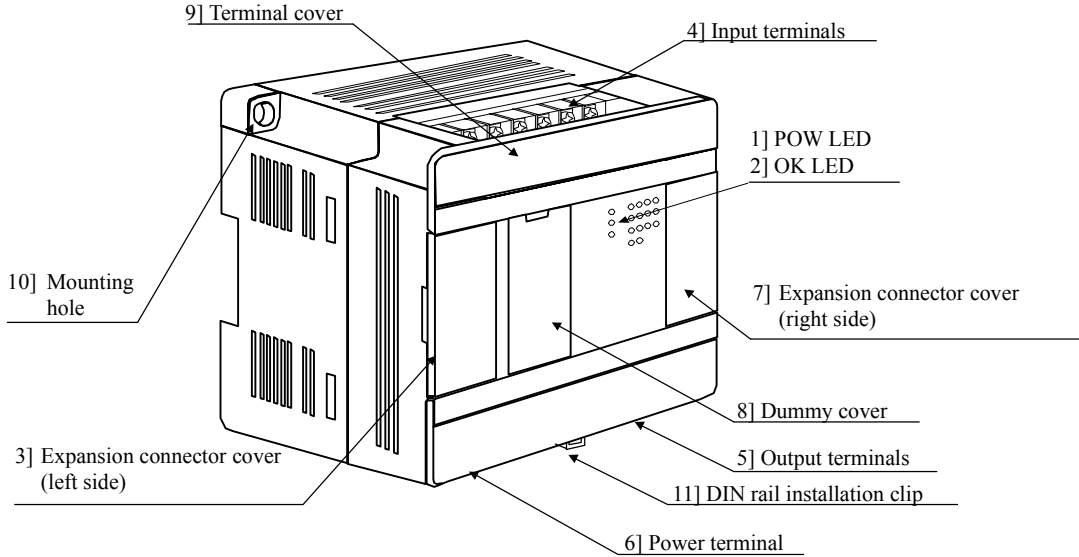

12] DIN rail installation clip

7] Power terminal

No.	Item	Detailed explanation	Remarks
Explanation of operation		Operations are performed according to the contents of the program created by the user. The programming unit connected to the CPU module communication port writes and reads the user programs. Memory is installed inside the CPU module in which the user programs and internal output information are stored.	
1]	POW LED	Lighting when the power is supplied.	
2]	OK LED	Lighting at normal operation.	See Chapter 12.
3]	RUN LED	Lighting at RUN status.	
4]	Serial port cover	Cover for the connector for connecting peripheral units and the RUN switch. When the cover is opened, the RUN switch, potentiometers (VR), and RS-232C serial port 1 (PORT 1) can be used. The communication specification is set to port 1. <div><div>STOP</div><div>RUN</div><div>VR1</div><div>VR2</div><div>PORT1</div></div>	See Chapters 8 and 11.
5]	Input terminals	Terminals for wiring the external input units. Recommended terminals are shown in the figure to the right. One piece of AWG14 to AWG22 (2.1 to 0.36 mm ²) or two pieces of AWG16 to AWG22 (1.3 to 0.36 mm ²) per terminal may be wired. <div><div></div><div></div></div>	See Chapter 10. (Make sure that the terminals will not disengage due to loose screws.) (Recommended)
6]	Output terminals	Terminals for connecting the external load. The wiring specification is the same as for the input terminals.	See Chapter 10.
7]	Power terminal	Terminal for connecting the power supply. The wiring specification is the same as for the input terminals.	See Chapter 10.
8]	Expansion cover	Cover for the expansion connector	See Chapter 10.
9]	DIP SW cover	Cover for the DIP switches and the backup battery storage unit. When the cover is opened, the DIP switches are exposed. These DIP switches are used to set the communication speed of serial port 1 and the modem connection.	See Chapter 11.
10]	Terminal cover	Cover for terminals	
11]	Mounting hole	Used when installing the PLC with screws	See Chapter 10.
12]	DIN rail installation clip	Used when installing the PLC on a DIN rail	See Chapter 10.
13]	RS-485 port cover	Cover for RS-485 port. It is connected with a D sub 15-pin female connector. The communication specification is set to port 2.	See Chapter 11.

4.5 Expansion Unit

Name and function of each part		Type	EH-*14ED** (same dimension as 14 pts. basic unit) EH-*28ED** (same dimension as 28 pts. basic unit) EH-*6EAN (same dimension as 14 pts. basic unit)
--------------------------------	--	------	---

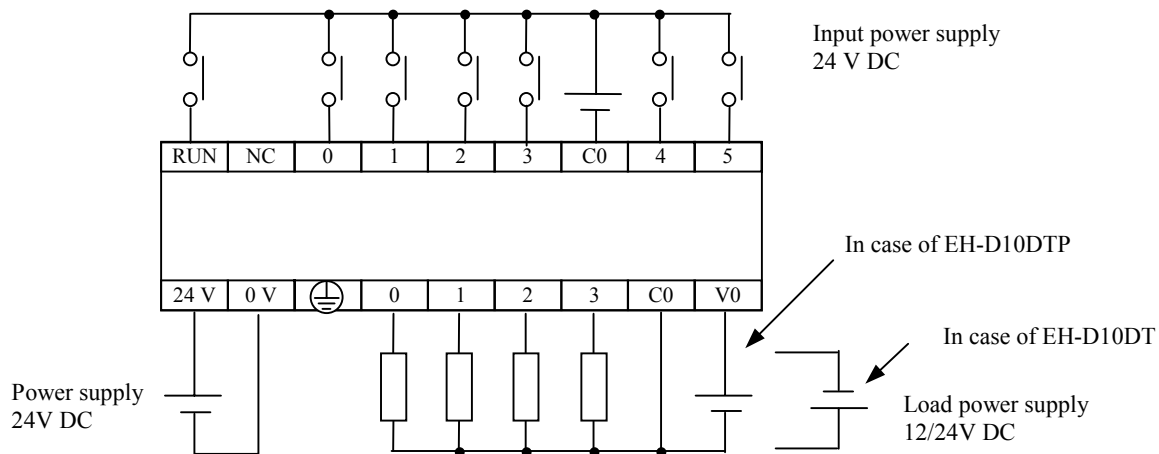

Above picture is 14 points module

No.	Item	Detailed explanation	Remarks
Explanation of operation		Operations are performed according to the contents of the program created by the user. The programming unit connected to the CPU module communication port writes and reads the user program. Memory is installed inside the CPU module in which the user program and internal output information are stored.	
1]	POW LED	Lighting when the power is supplied.	
2]	OK LED	Lighting at normal operation.	
3]	Expansion cover (Left side)	Cover for expansion connector Used when connecting to the expansion cable from the front unit.	See Chapter 10.
4]	Input terminals	Terminals for wiring the external input units. Recommended terminals are shown in the figure to the right. One piece of AWG14 to AWG22 (2.1 to 0.36 mm ²) or two pieces of AWG16 to AWG22 (1.3 to 0.36 mm ²) per terminal may be wired.	See Chapter 10. (Make sure that the terminals will not disengage due to loose screws.) (Recommended)
5]	Output terminals	Terminals for connecting the external load. The wiring specification is the same as for the input terminals.	See Chapter 10.
6]	Power terminal	Terminal for connecting the power supply. The wiring specification is the same as for the input terminals.	See Chapter 10.
7]	Expansion cover (Right side)	Cover for expansion connector Used when connecting to the next unit.	See Chapter 10.
8]	Dummy cover	Cover used as a dummy.	
9]	Terminal cover	Cover for terminals	
10]	Mounting hole	Used when installing the PLC with screws	See Chapter 10.
11]	DIN rail installation clip	Used when installing the PLC on a DIN rail	See Chapter 10.

4.6 Terminal Layout and Wiring

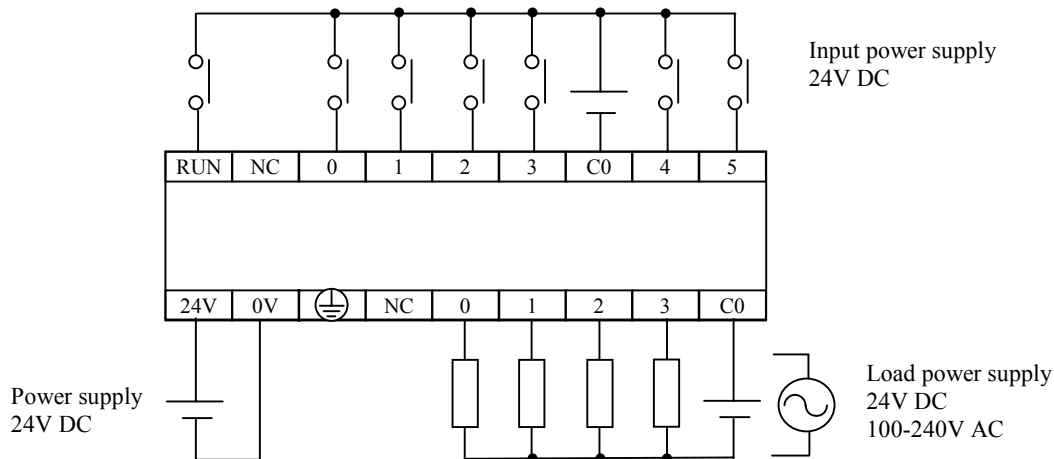

10-point type
EH-D10DT, EH-D10DTP

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

EH-D10DR

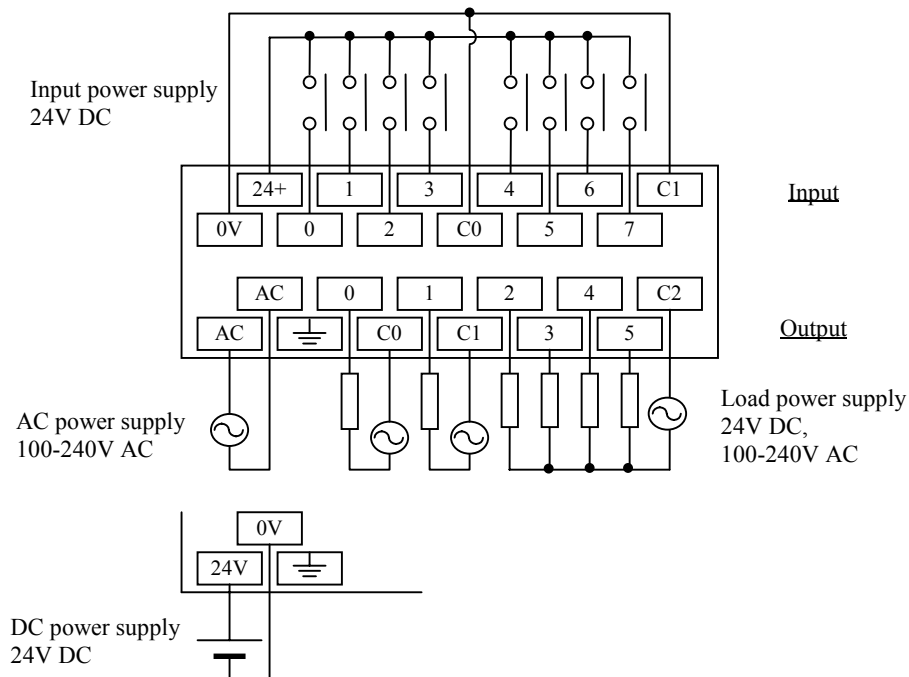

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

14-point type

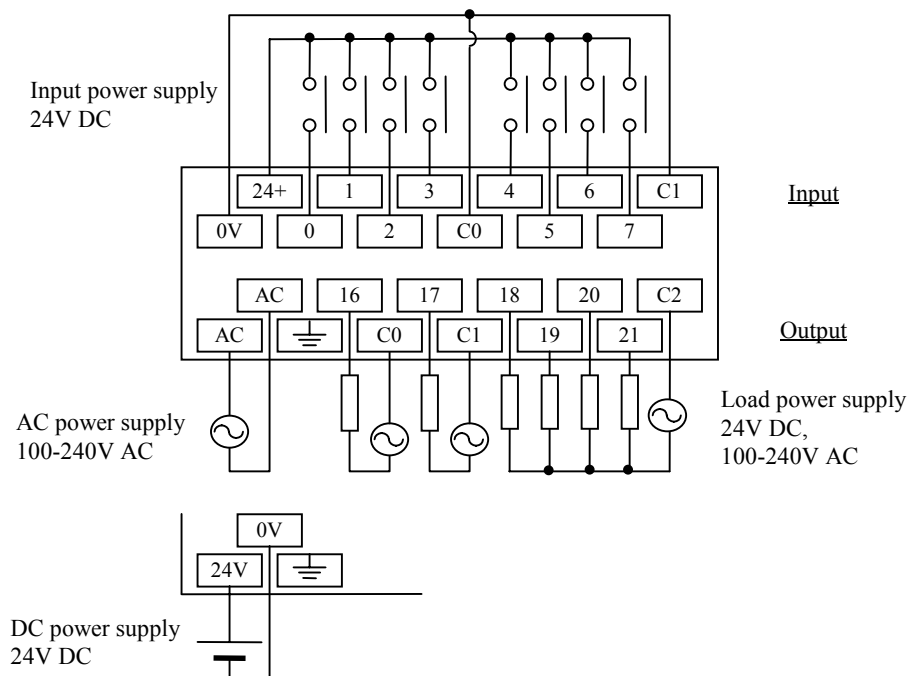

EH-A14DR, EH-D14DR

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

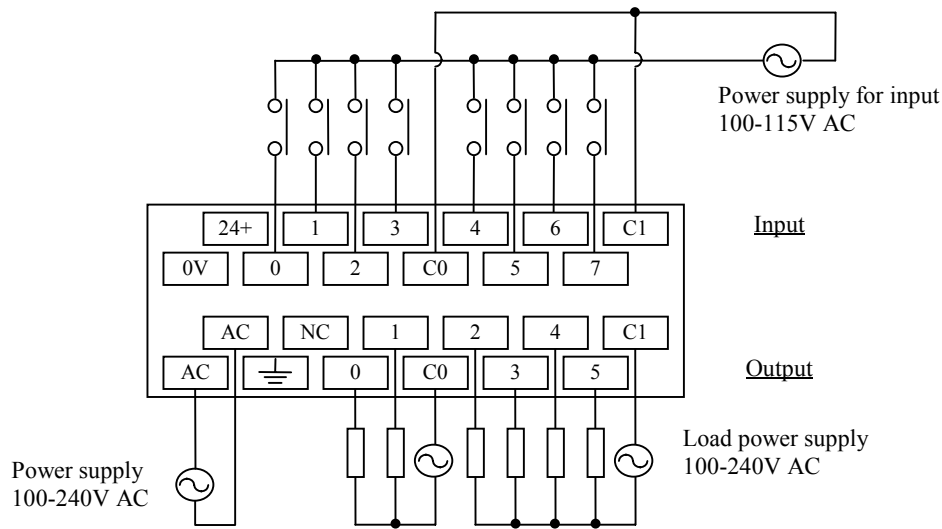

EH-A14EDR, EH-D14EDR

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

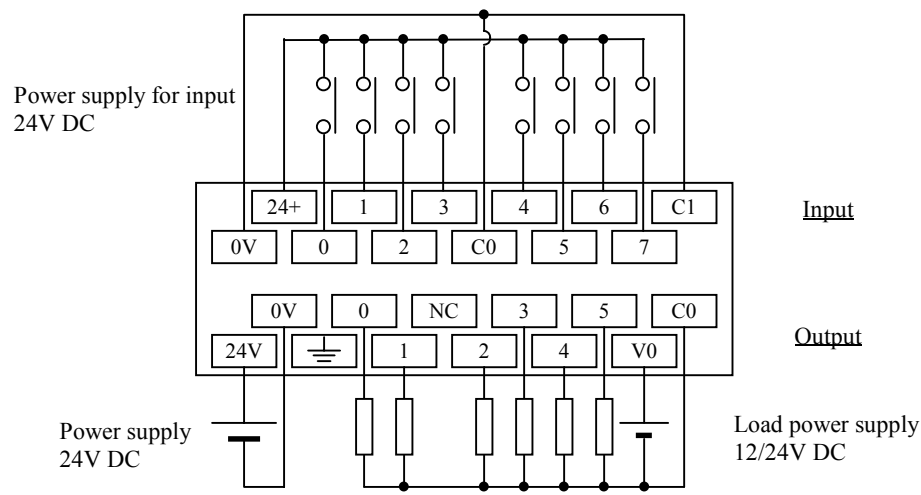

EH-A14AS

EH-D14DTP

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

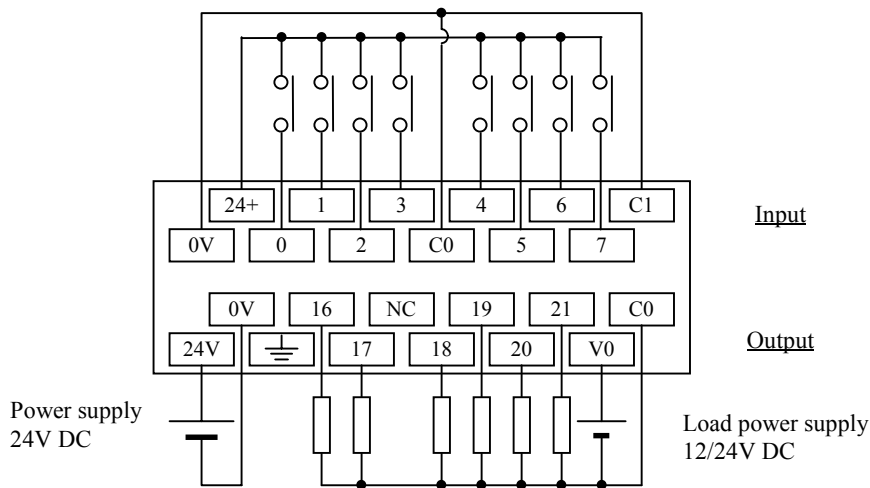

EH-D14DT

(The input wiring is the same as EH-D14DTP.)

EH-D14EDTP

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

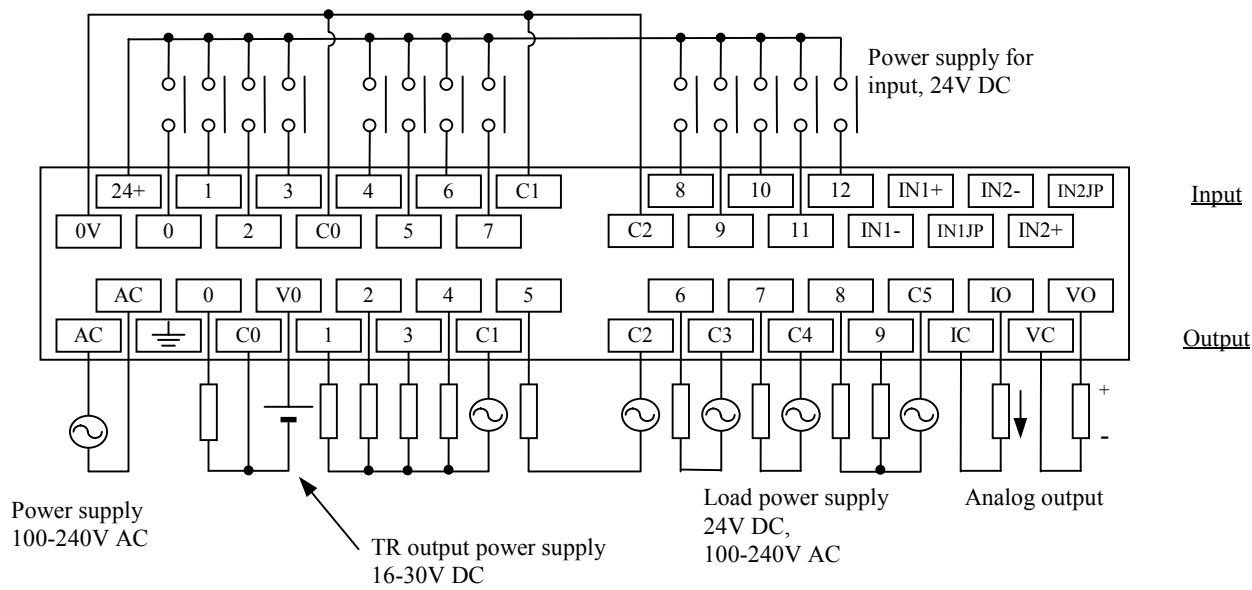

EH-D14EDT

(The input wiring is the same as EH-D14EDTP.)

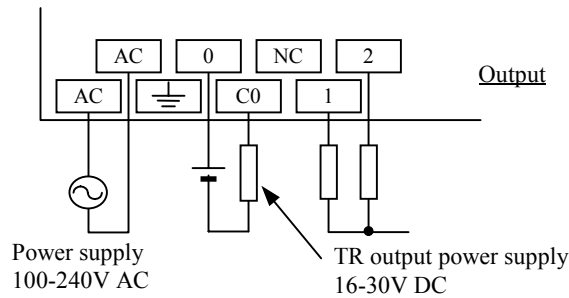

23-point type
EH-A23DRP

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

EH-A23DRT
(The input wiring is the same as EH-A23DRP.)

EH-D23DRP

Analog voltage input

Analog current input

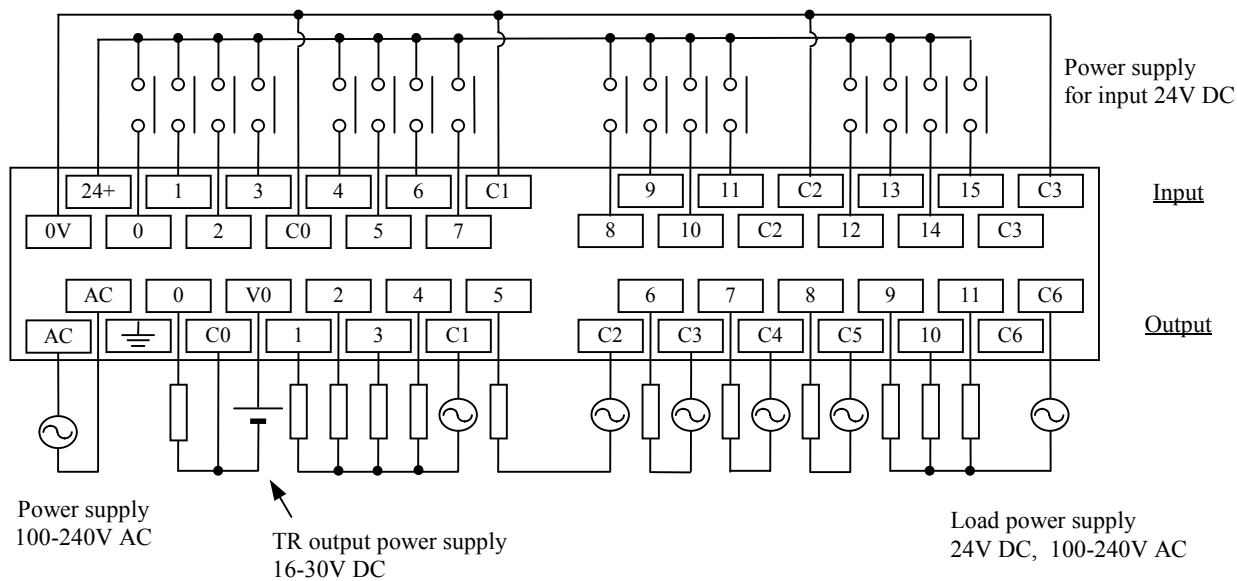

In case of analog current input, please set the following value in **WRF06E**.

WRF06E	ch-0	ch-1
H0000	Voltage	Voltage
H4000	Voltage	Current
H8000	Current	Voltage
HC000	Current	Current

Please refer to Chapter 8-9.

28-point type
EH-A28DRP

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

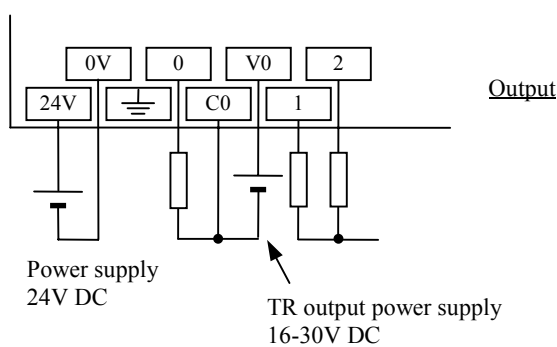

EH-A28DRT

(The input wiring is the same as EH-A28DRP.)

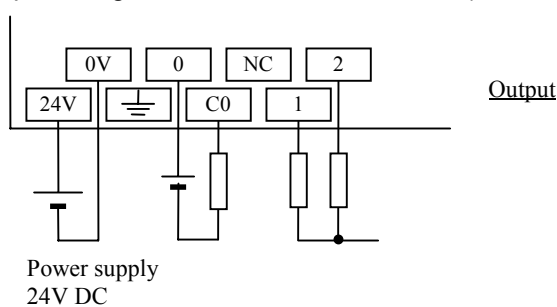

EH-D28DRP

(The input wiring is the same as EH-A28DRP.)

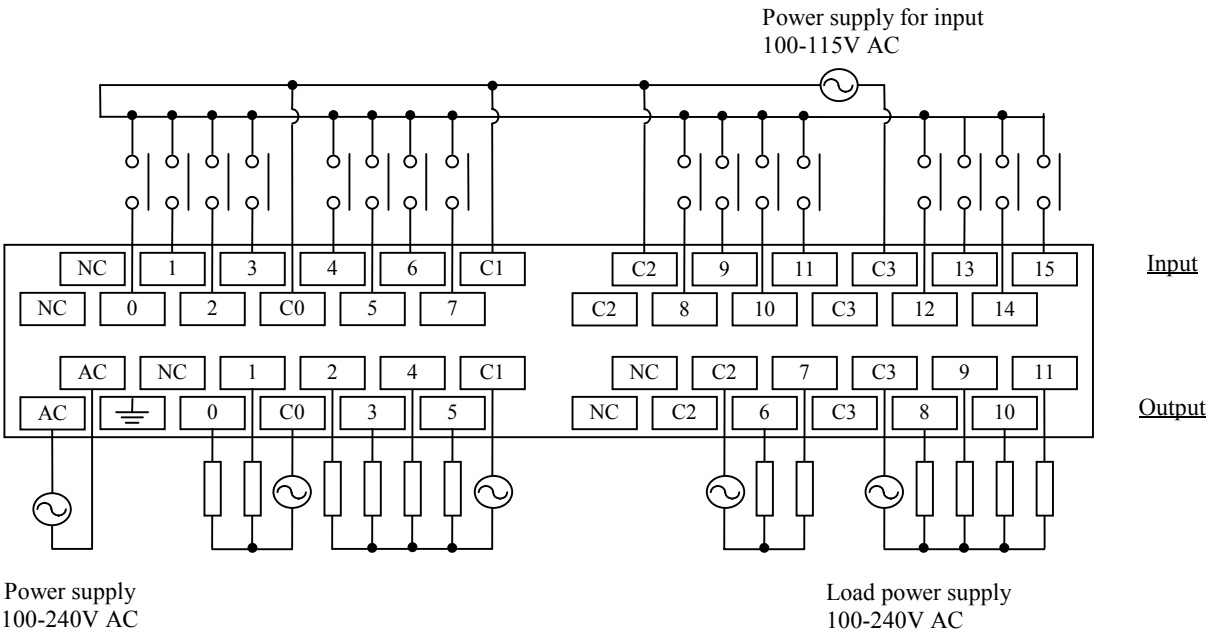

EH-D28DRT

(The input wiring is the same as EH-A28DRP.)

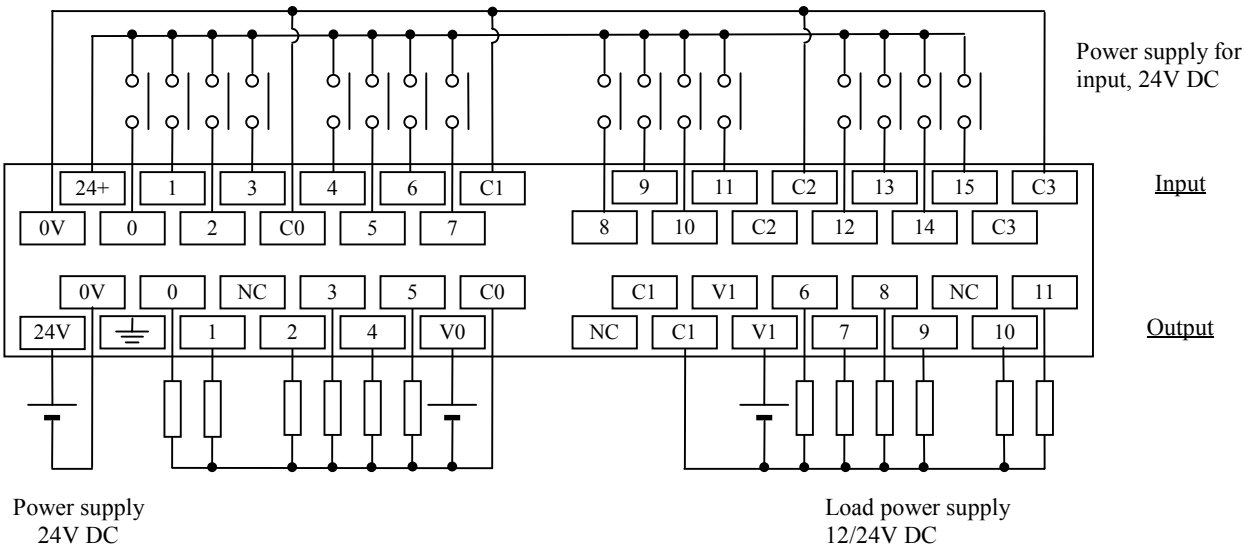

EH-A28AS

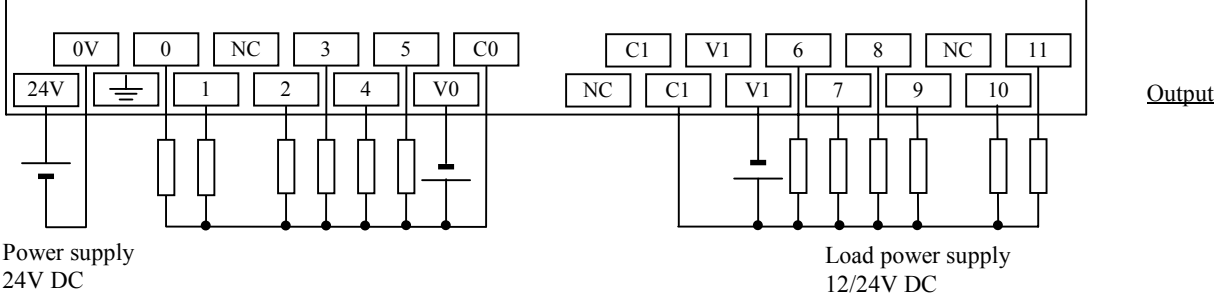

EH-D28DTP

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

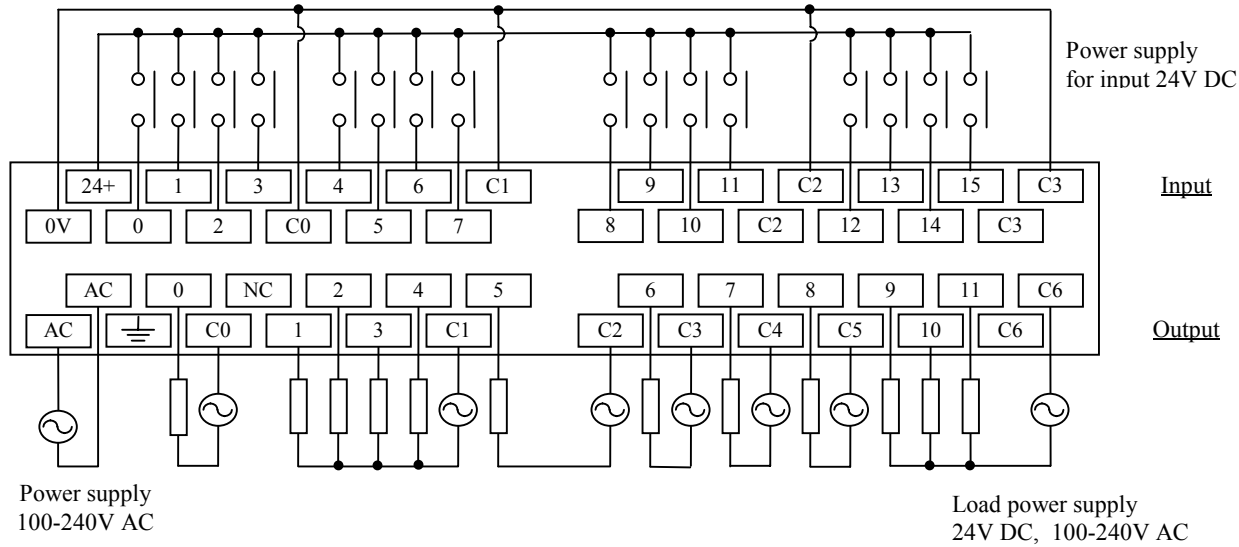

EH-D28DT

(The input wiring is the same as EH-D28DTP.)

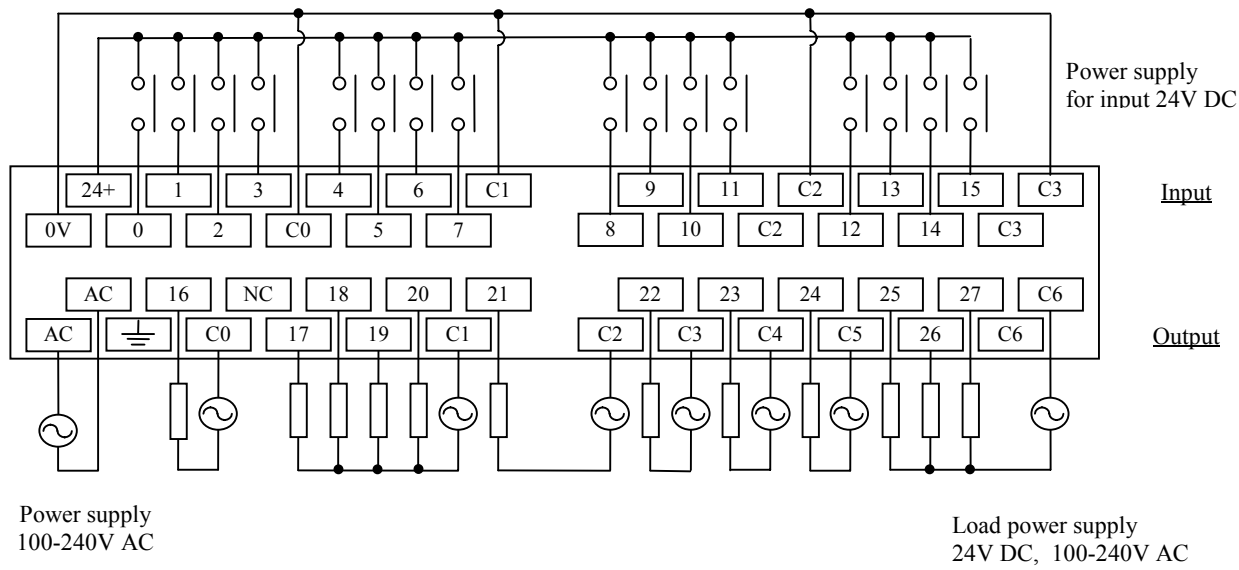

EH-A28DR

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

EH-A28EDR

* Since the DC input is bidirectional, it is possible to reverse the polarity of the power supply.

EH-D28DR

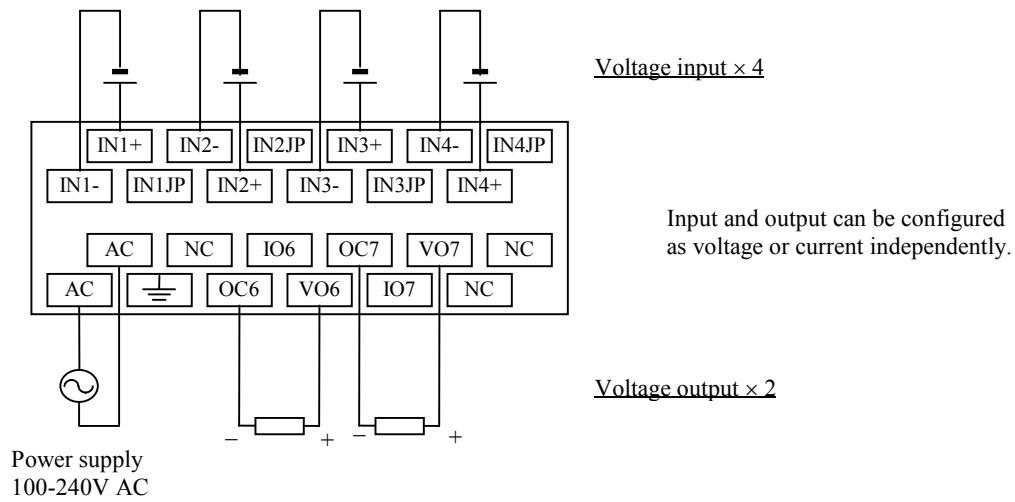

EH-D28EDR

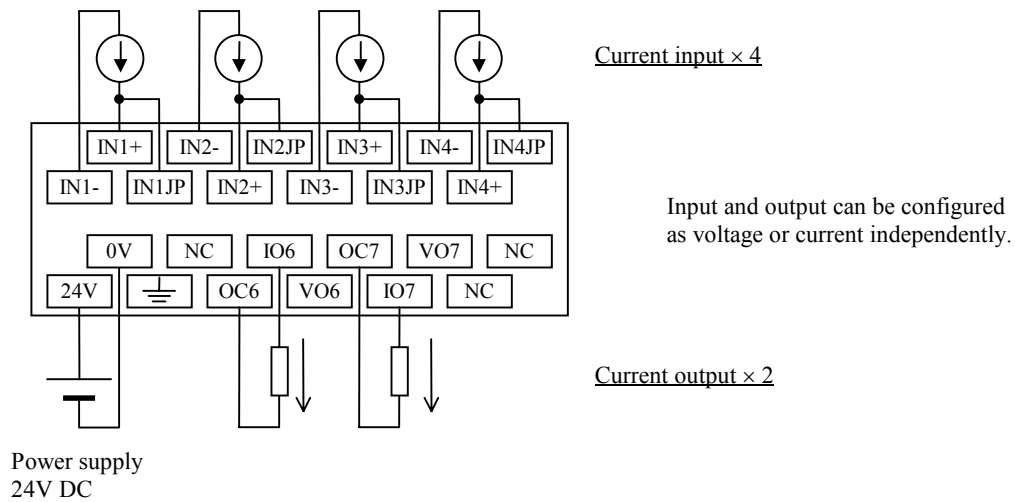

Analog expansion unit

EH-A6EAN (Example of voltage input and voltage output)

EH-D6EAN (Example of current input and current output)

4.7 Weights and Power Consumption

Type	Weight (g)	Power consumption (A)						Remarks
		100V AC		264V AC		24V DC		
		Normal	Rush	Normal	Rush	Normal	Rush	
EH-D10DT/DTP/DR	200	-	-	-	-	0.12	0.6	
EH-D14DT/DTP/DTPS	300	-	-	-	-	0.16	0.6	
EH-A14DR	400	0.1	15	0.06	40	-	-	
EH-D14DR	300	-	-	-	-	0.16	0.6	
EH-A14AS	380	0.1	15	0.06	40	-	-	
EH-A23DRP/DRT	600	0.2	15	0.06	40	-	-	
EH-D23DRP	500	-	-	-	-	0.2	0.6	
EH-D28DT/DTP/DTPS	500	-	-	-	-	0.2	0.6	
EH-A28DRP/DRT	600	0.1	15	0.06	40	-	-	
EH-A28DR	600	0.2	15	0.06	40	-	-	
EH-D28DRP/DRT	500	-	-	-	-	0.3	0.6	
EH-D28DR	500	-	-	-	-	0.3	0.6	
EH-A28AS	600	0.2	15	0.06	40	-	-	
EH-D14EDT/EDTP/EDTPS	300	-	-	-	-	0.16	0.6	
EH-A14EDR	400	0.1	15	0.06	40	-	-	
EH-D14EDR	300	-	-	-	-	0.16	0.6	
EH-D28EDT/EDTPS	500	-	-	-	-	0.2	0.6	
EH-A28EDR	600	0.2	15	0.06	40	-	-	
EH-D28EDR	500	-	-	-	-	0.3	0.6	
EH-A6EAN	400	0.1	15	0.06	40	-	-	
EH-D6EAN	300	-	-	-	-	0.16	0.6	

4.8 Exterior Dimensions

(1) 10-point type

(Unit : mm)

(2) 14-point type, 14-point expansion unit, Analog expansion unit

(3) 23-point, 28-point types and 28-point expansion

MEMO

Chapter 5 Instruction Specifications

5.1 Instruction Classifications

The instructions used with the MICRO-EH are classified as shown in the following table.

Table 5.1 Instruction classification table

No.	Instruction classification	Description	Type
1	Basic instructions	Sequence	21
		Timer/counter	6
		Relational box	8
2	Arithmetic instructions	Substitution (array variable)	1
		Mathematical operations	10
		Logical operations	3
		Relational expression	8
3	Application instructions	Bit operation	3
		Shift/rotate	8
		Transfer	3
		Negation/Two's complement/Sign	3
		Conversion	4
		Application: BCU, SWAP, UNIT, DIST	4
4	Control instructions	END, JMP, CAL, FOR, NEXT, RTS, RTI, LBL, SB, INT, CEND, CJMP	12
5	Transfer instructions	TRNS 0, RECV 0	2
6	FUN instructions	Refresh, high-speed counter, PMW, pulse, comments	18

5.2 List of Instructions

[Legend]

Condition codes

DER	Data error (special internal output R7F4) Set to "1" as a data error when the I/O number is exceeded or when the BCD was abnormal data, etc. When there is no data error, it is set to "0."
ERR	Error (special internal output R7F3) Set to "1" when an error is generated when a control instruction and a special instruction are executed. The error code is set in WRF015. When there are no errors, the previous status is maintained.
SD	Shift data (special internal output R7F2) Performs shift-in of the contents of SD by the SHR or SHL instruction.
V	Over flow (special internal output R7F1) Indicates that a digit overflow has occurred and the signed data range is exceeded as a result of signed data operations.
C	Carry (special internal output R7F0) Indicates the contents of digit increase due to addition, digit decrease due to subtraction, and shift-out due to shifting.
●	Maintains the previous status.
1]	Set to "1" when there is an error in operation results. The previous status is maintained if there is no error.
↑	Changes according to the operation result.

Processing time This indicates the instruction processing time.
The displayed value is an average. It varies depending on the parameter and data count with the instructions used.
See the details on the instruction specifications for details.

The following lists the instructions.

1. Basic instructions (sequence instructions)

Classification	Item number	Ladder symbol	Instruction symbol	Instruction name	Process descriptions	I/O types used	R7F4	R7F3	R7F2	R7F1	R7F0	Process time (μs)	Steps	Remarks	
							DER	ERR	SD	V	C	MICRO-EH			
Sequence instructions	1		LD	Logical operation start	Indicates the commencement of a-contact operation.	X, Y R0 to R7BF M0 to M3FFF TD, SS, CU, CT Timer: 0 to 255 Counter: 0 to 255 DIF0 to DIF511 DFN0 to DFN511	●	●	●	●	●	0.9	1		
	2		LDI	Logical negation operation start	Indicates the commencement of b-contact operation.							0.8			
	3		AND	Logical AND	Indicates a-contact series connection.										
	4		ANI	Logical NAND	Indicates b-contact series connection.							0.9	2		
	5		OR	Logical OR	Indicates a-contact parallel connection.		●	●	●	●	●				
	6		ORI	Logical NOR	Indicates b-contact parallel connection.		●	●	●	●	●				
	7		NOT	Logical NOT	Reverses all operation results up to that point.	None	●	●	●	●	●	0.8	2		
	8		AND DIF	Leading edge detection	Indicates detection of the input rise.	DIF0 to DIF511 (Decimal)	●	●	●	●	●	1.0	3 4	Number overlap not allowed	
			OR DIF												
	9		AND DFN	Trailing edge detection	Indicates detection of the input fall.	DFN0 to DFN511 (Decimal)	●	●	●	●	●	1.2	3 4	Number overlap not allowed	
			OR DFN												
	10		OUT	I/O output	Indicates an output coil.	X, Y R0 to R7BF M0 to M3FFF TD, SS, CU, CTU, CTD, CL Timer: 0 to 255 Counter: 0 to 255	●	●	●	●	●	1.0	1		
	11		SET	I/O set	Indicates set output.	X, Y R0 to R7BF M0 to M3FFF	●	●	●	●	●	0.9	1		
	12		RES	I/O reset	Indicates reset output.										
13		MCS	Set master control	Indicates master control set operation.	MCS0 to MCS49	●	●	●	●	●	0.7	3	Number overlap allowed		
14		MCR	Reset master control	Indicates master control reset operation.	MCR0 to MCR49	●	●	●	●	●	0.7	2	Number overlap allowed		

Classification	Item number	Ladder symbol	Instruction symbol	Instruction name	Process descriptions	I/O types used	R7F4	R7F3	R7F2	R7F1	R7F0	Process time (μs)	Steps	Remarks
							DER	ERR	SD	V	C			
Sequence instructions	15		MPS	Operation result push	Stores the previous operation result.	None	●	●	●	●	●	—	0	
	16		MRD	Operation result read	Reads the stored operation result and continues operation.									
	17		MPP	Operation result pull	Reads the stored operation result, continues operation and clears the stored result.									
	18		ANB	Logical block serial connection	Indicates serial connection between two logical blocks.	None	●	●	●	●	●	—	0	
	19		ORB	Logical block parallel connection	Indicates parallel connection between two logical blocks.	None						0.7	1	
	20		[]	Processing box start and end	Indicates start and end of a process box.	None	●	●	●	●	●	0.6	3	
	21		()	Relational box start and end	Indicates start and end of a comparison box.	None	●	●	●	●	●	0.8	0	

2. Basic instructions (timer, counter)

Classification	Item number	Ladder symbol	Instruction symbol	Instruction name	Process descriptions	I/O types used	R7F4	R7F3	R7F2	R7F1	R7F0	Process time (μs)	Steps	Remarks
							DER	ERR	SD	V	C			
Timer	22		OUT TD	On delay timer	Indicates an on delay timer operation.	TD0 to TD255 When 0.01 s, it is possible to use until 0 to 63.	●	●	●	●	●	1.4	5	Number overlap not allowed
	23		OUT SS	Single shot	Indicates a single shot operation.	SS0 to SS255 When 0.01 s, it is possible to use 0 to 63.	●	●	●	●	●	1.4	5	
Counter	24		OUT CU	Counter	Indicates a counter operation.	CU0 to CU255	●	●	●	●	●	1.4	5	
	25		OUT CTU	Up of up/down counter	Indicates an up operation of up-down counter.	CTU0 to CTU255	●	●	●	●	●	1.4	5	
	26		OUT CTD	Down of up/down counter	Indicates a down operation of up-down counter.	CTD0 to CTD255	●	●	●	●	●	1.4	3	
	27		OUT CL	Counter clear	Indicates a clear operation for CU, RCU, CTU, CTD and WDT.	CL0 to CL255	●	●	●	●	●	0.9	1	

3. Basic instructions (relational box)

Classification	Item number	Ladder symbol	Instruction symbol	Instruction name	Process descriptions	I/O types used	R7F4	R7F3	R7F2	R7F1	R7F0	Process time (μs)	Steps	Remarks
							DER	ERR	SD	V	C			
Relational box	28		LD (s1=s2)	= Relational box	When s1 = s2: Continuity When s1 ≠ s2: Noncontinuity	[Word] WX, WY, WR, WM, Timer Counter [Double word] DX, DY, DR, DM Constant	●	●	●	●	●	27	5 6 7 8	*1 *2 Upper case: W Lower case: DW
			AND (s1=s2)									35

5.3 Instruction Specification Details

(1) Basic instructions	
(2) Arithmetic instructions	
(3) Application instructions	
(4) Control instructions	
(5) Transfer instructions	
(6) FUN instructions	

Item number		Basic instructions-1, 2				Name		Logical operation start (LD, LDI)									
Ladder format						Condition code					Processing time (μs)			Remark			
						R7F4	R7F3	R7F2	R7F1	R7F0	Average	Maximum	0.9 ←				
						DER	ERR	SD	V	C							
						●	●	●	●	●							
Instruction format						Number of steps											
LD n						Condition				Steps							
LDI n						—				1							
Usable I/O				Bit				Word				Double word			Constant	Other	
				X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM			
n	I/O number					○	○	○	○								
Function																	
 Starts the a-contact logical operation. Enters the continuity state when input is on.																	
 Starts the b-contact logical operation. Enters the continuity state when input is off.																	
Notes																	
<ul style="list-style-type: none">Edge detection (DIF, DFN) cannot be used in respect to LDI.Pay close attention if the external output is to be monitored when counter input (coincidence output), PWM output or pulse output is set with the PI/O function.  <p>Y100 will not change while monitored. It will remain the same value previously set using functions such as set/reset. For example, if Y100 is off, the Y100 status will not change while being monitored and WRO will also remain unchanged.</p>																	
Program example																	
										<div><div>LD X00000</div><div>OUT Y00100</div><div>LDI X00001</div><div>OUT Y00101</div></div>							
Program description																	
<ul style="list-style-type: none">When input X00000 is on, output Y00100 is on; when off, the output is off.When input X00001 is off, output Y00101 is on; when on, the output is off.

n	Timer number												○	0 to 255 (Decimal)			
t	Time base													.01s, .1s, 1s			
s	Set value					○	○	○					○	1 to 65535 (Decimal)			
Function		<ul style="list-style-type: none">The progress value is updated when the startup condition is on, and the coil turns on when the progress value is greater than or equal to the set value.If the startup condition is turned off, the progress value is cleared and the coil turns off.The progress value is set in TC n and does not exceed 65535 (decimal).If the progress value is updated during RUN, the operation will be performed using the new progress value at that point.If an I/O is set for the set value, the set value can be changed during operation by changing the I/O value, since the set values are updated during each scan.															
Notes		<ul style="list-style-type: none">The .01s time base can only be used for timer numbers 0 to 63 (64 points).The .1 s and 1 s time bases can be used for all timer numbers (0 to 255).A maximum of 256 points can be used for the timers TD, SS, CU, CTU and CTD in total. However, the same area as the counter is used. The timer numbers and counter numbers may not be overlapped.															
Program example		<div><pre>LD X00000 OUT TD10 0.01S 12345 LD TD10 OUT R100</pre></div> <ul style="list-style-type: none">An example of a word I/O being used as the set value for the circuit shown above. <div><pre>LD R7E3 [WR0010=12345] LD X00000 OUT TD10 0.01S WR0010 LD TD10 OUT R100</pre></div>															

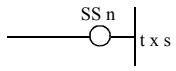

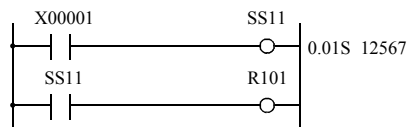

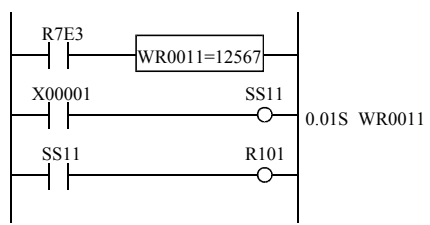

Program description

[Time chart]

- 1] When input X00000 turns on, TD progress value is updated.
- 2] When input X00000 turns off, the TD progress value is cleared.
- 3] TD10 turns on when progress value \geq set value.
- 4] While X00000 is on, the progress value increases, but will not increase exceeding 65535.
- 5] When X00000 turns off, TD10 also turns off and the progress value is cleared.

- Example using word I/O as the set value
When RUN is commenced, the set value is set to the word I/O.
Or, the word I/O for the set value is designated to store in the power failure memory.

Item number		Basic instructions-23				Name		Single shot (SINGLE SHOT)

				●	●	●	●	●							
Instruction format				Number of steps					1.4			—			
OUT SS n t s				Condition		Steps									
				—		5									
Usable I/O				Bit			Word			Double word			Constant	Other	
				X	Y	R, M	TD, SS, WDT, MS, TMR, CU, RCU, CT	WX	WY	WR, WM	TC	DX			DY
n	Timer number													○	0 to 255 (Decimal)
t	Time base														.01s, .1s, 1s
s	Set value							○	○	○				○	1 to 65535 (Decimal)
Function															
<ul style="list-style-type: none">• Detects the leading edge of the startup condition, starts updating progress values, and turns on the coil.• The coils turns off when the progress value is greater than or equal to the set value. If a leading edge is detected while the progress value is less than the set value, the progress value is set to 0 and the counter is reset.• The progress value is set in TC n and does not exceed 65535 (decimal).• If the progress value is updated during RUN, the operation will be performed using the new progress value at that point.• If an I/O is set for the set value, the set value can be changed during operation by changing the I/O value, since the set values are updated during each scan.															
Notes															
<ul style="list-style-type: none">• The .01 s time base can only be used for timer numbers 0 to 63 (64 points).• The .1 s and 1s time bases can be used for all timer numbers (0 to 255).• A maximum of 256 points can be used for the timers TD, SS, CU, CTU and CTD in total. However, the same area as the counter is used. Timer number and counter number may not be overlapped.• Since the startup condition of a single shot is edge detection, the condition for one scan cannot be detected during the first scan after RUN starts.															
Program example															
				<pre>LD X00001 OUT SS11 0.01S 12567 LD SS11 OUT R101</pre>											
<ul style="list-style-type: none">• An example of a word I/O being used as the set value for the circuit shown above.															
				<pre>LD R7E3 [WR0011=12567] LD X00001 OUT SS11 0.01S WR0011 LD SS11 OUT R101</pre>											

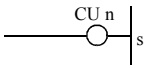

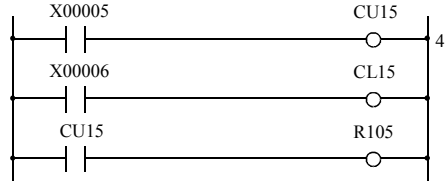

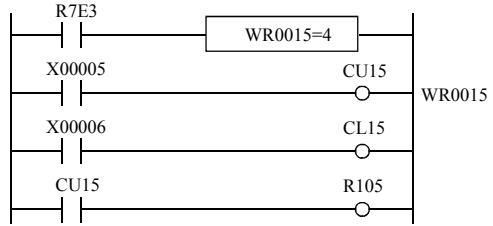

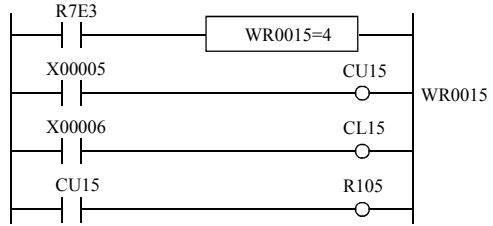

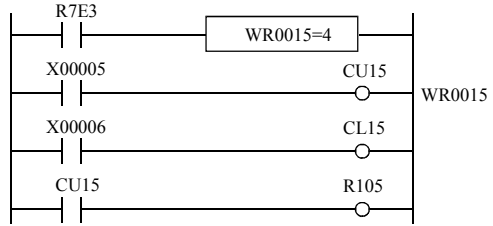

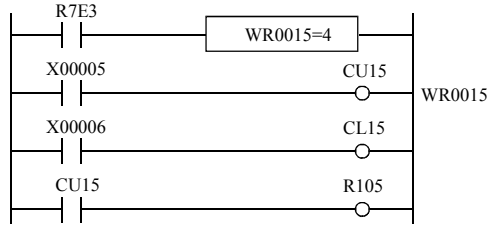

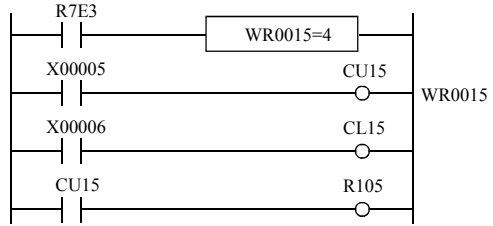

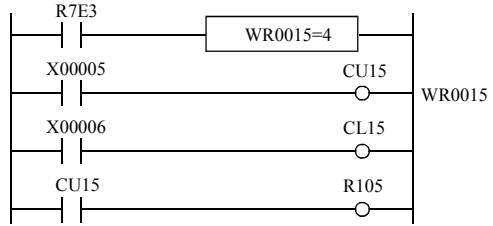

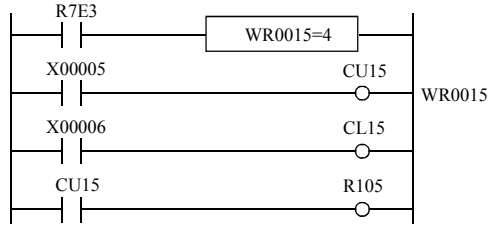

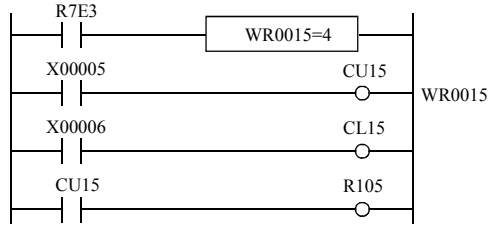

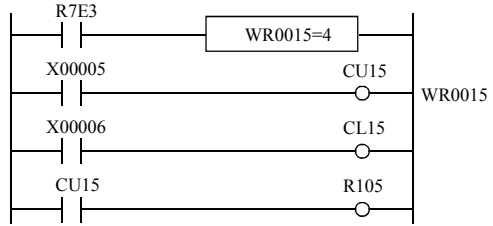

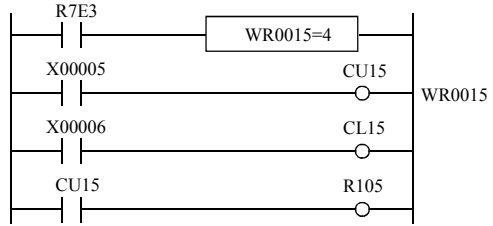

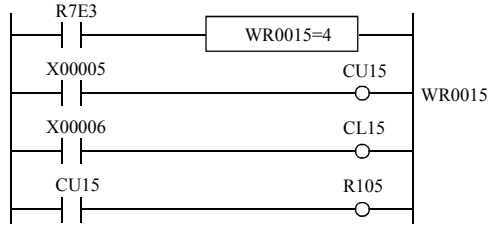

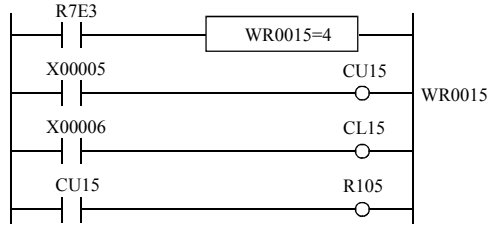

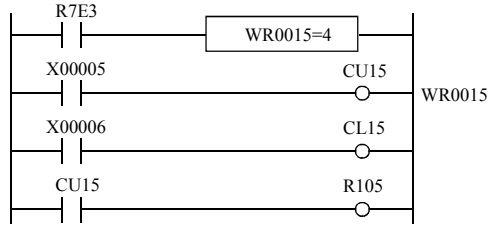

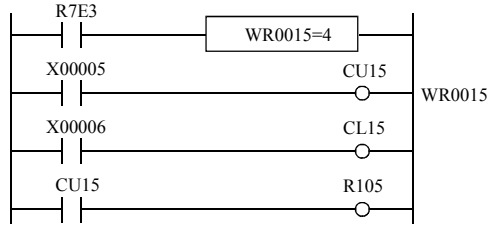

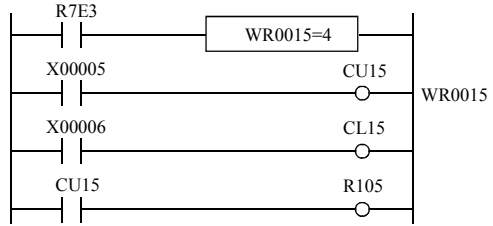

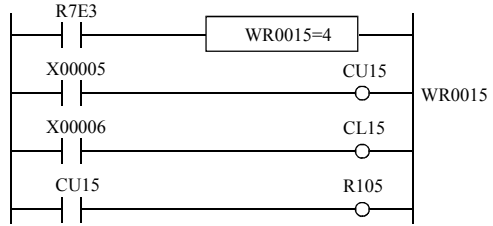

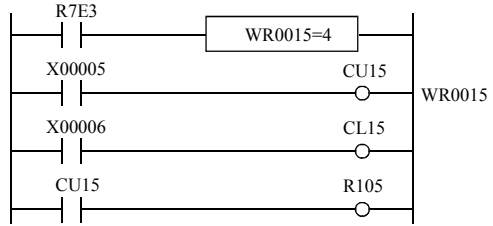

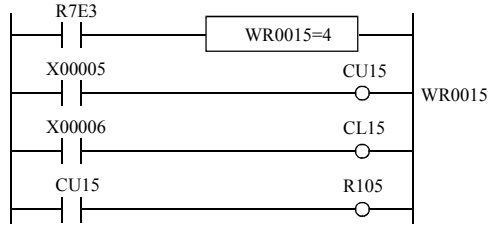

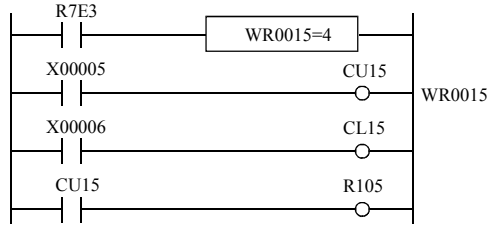

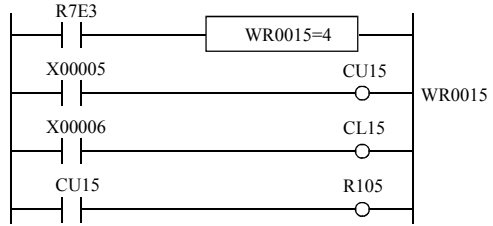

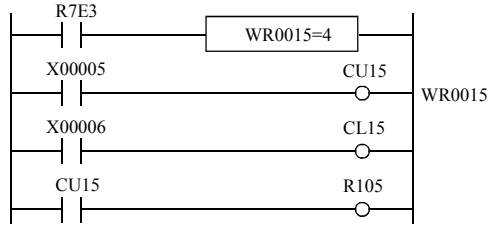

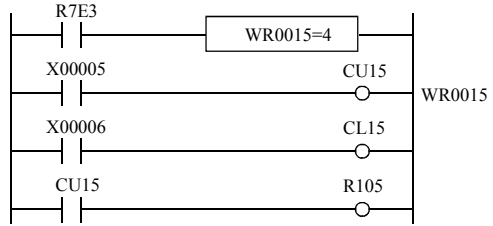

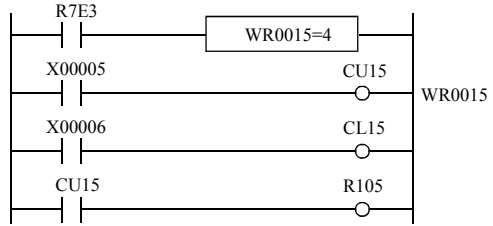

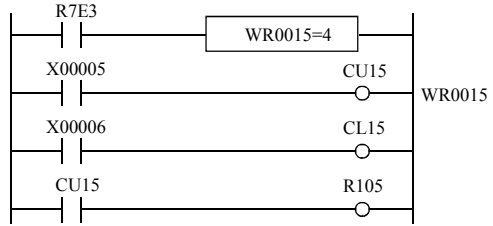

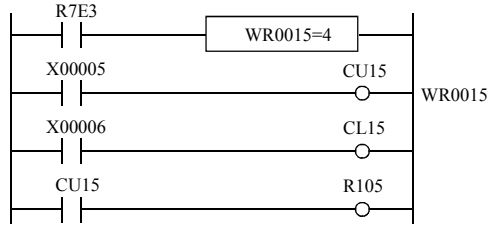

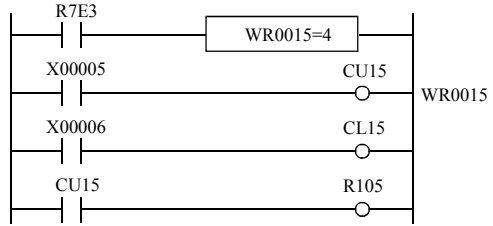

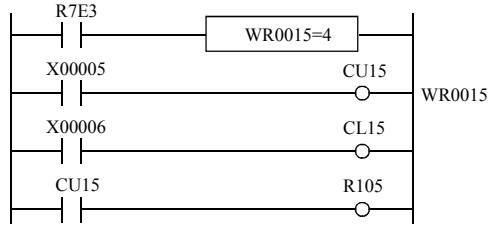

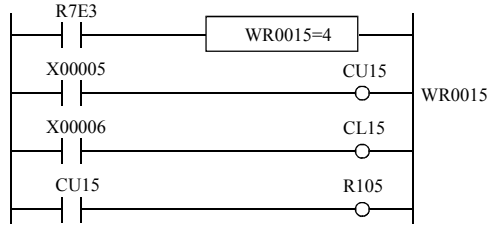

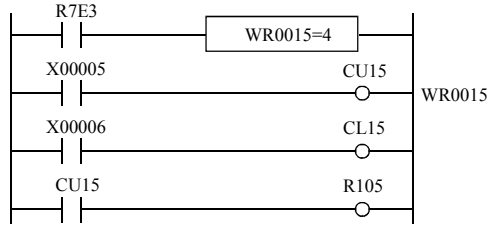

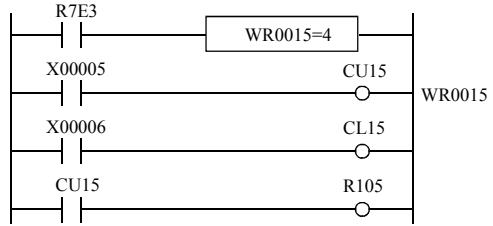

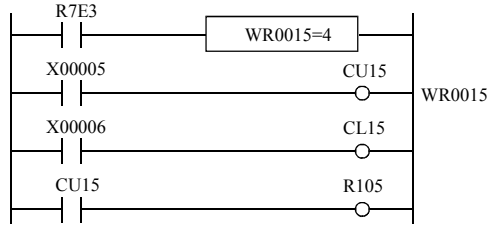

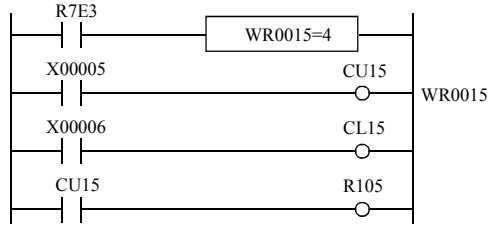

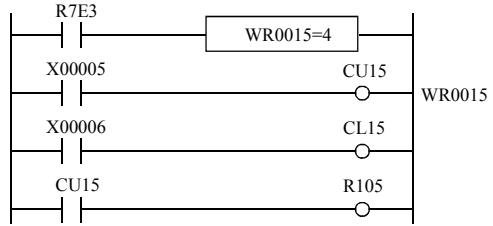

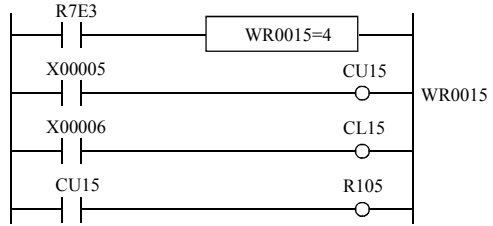

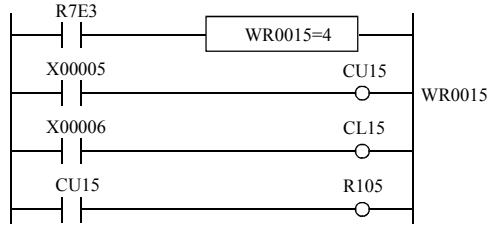

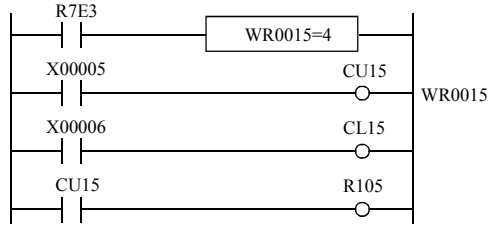

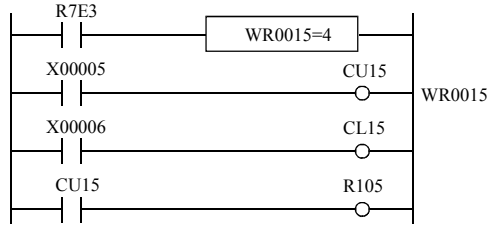

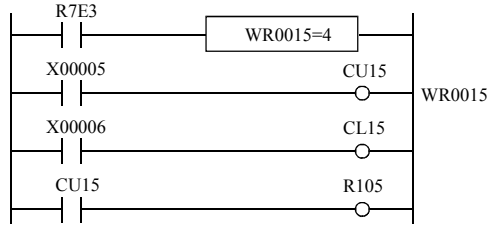

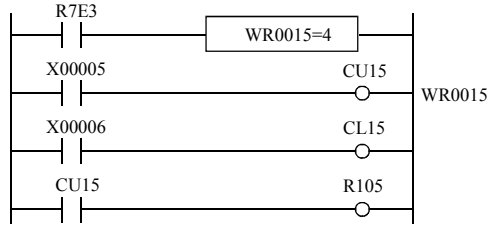

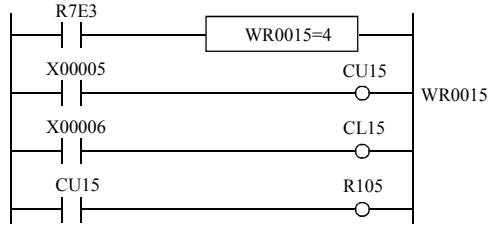

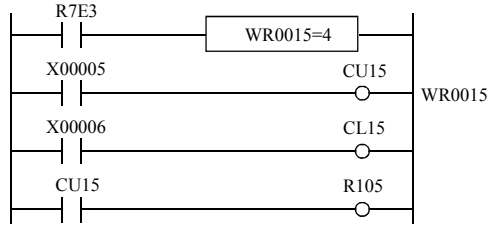

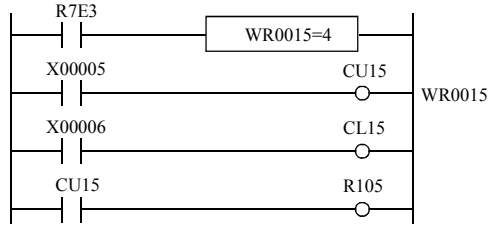

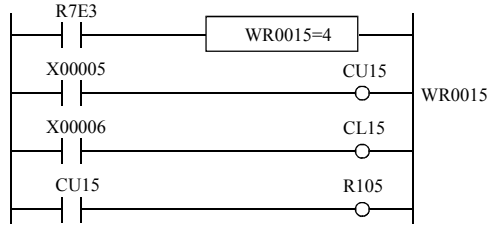

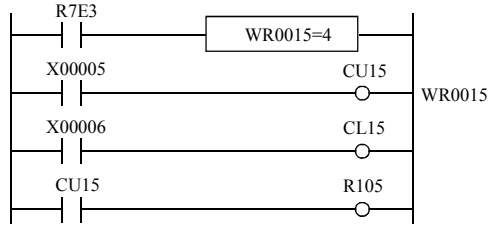

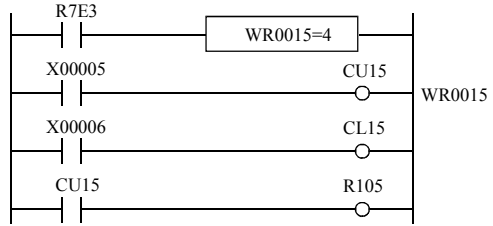

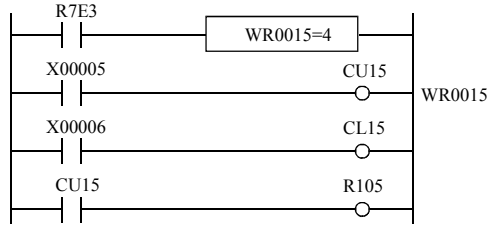

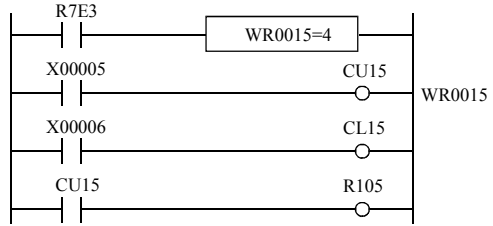

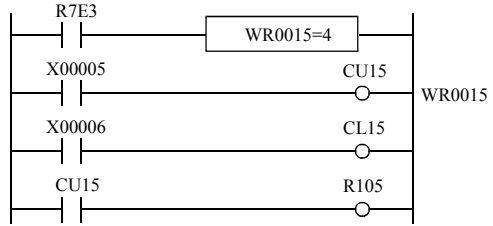

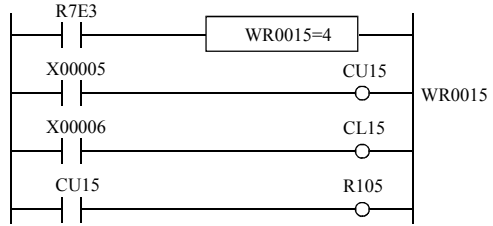

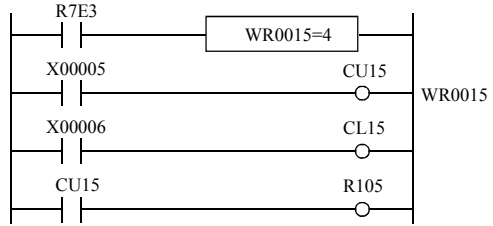

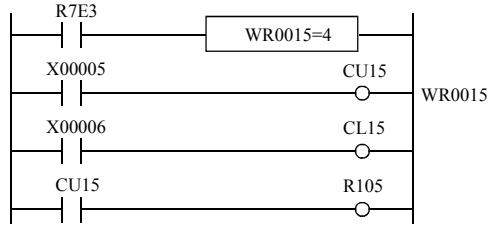

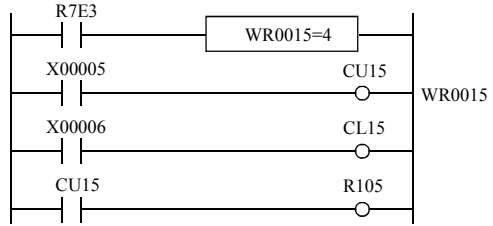

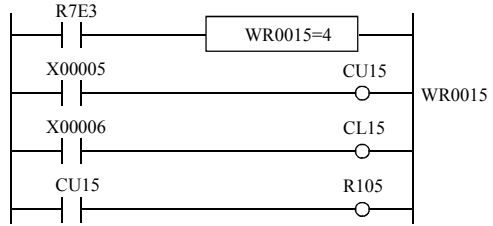

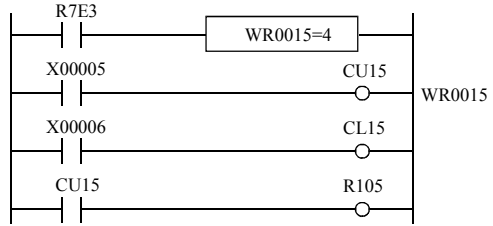

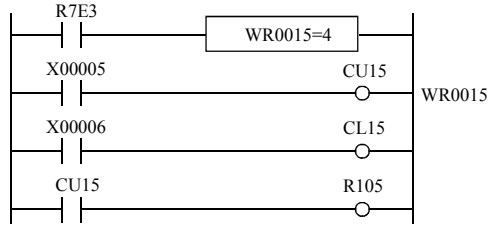

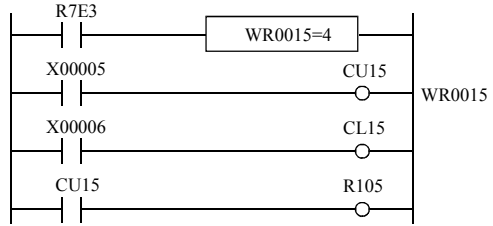

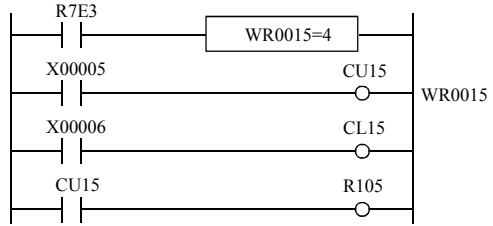

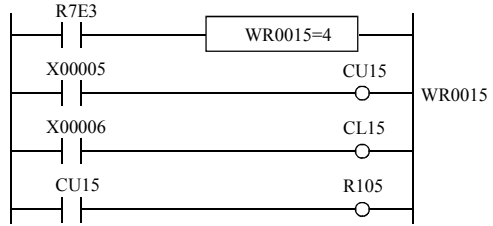

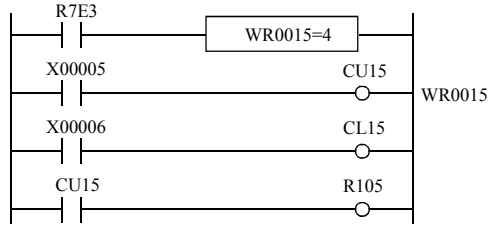

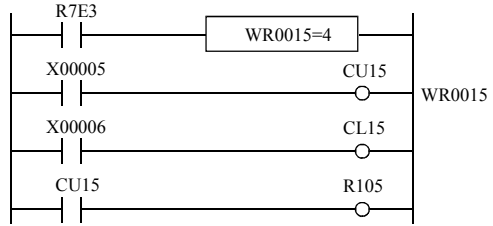

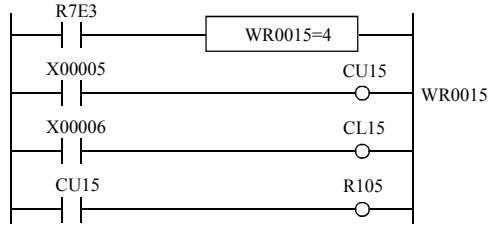

Program description

[Time chart]

- 1] The progress value is updated and SS11 turns on at the leading edge of X00001.
- 2] SS11 turns off when set value \geq progress value. X00001 is turned on at this time, but the single shot startup conditions are ignored because it uses edge trigger.
- 3] SS11 is turned on at the leading edge of X00001 again, and the progress value is updated.
- 4] When the leading edge of X00001 is detected while the progress value does not reach the set value, the single shot timer is triggered again and the progress value returns to 0, then starts increasing. The SS11 remains on.

- Example using word I/O as the set value
When RUN is commenced, the set value is set to the word I/O.
Or, the word I/O for the set value is designated to store in the power failure memory.

Program description

[Time chart]

- 1] The progress value (count) is cleared to 0 by the counter clear (CL15). While the counter clear is on, the progress value will not be updated.
 - 2] The progress value is updated at the leading edge of X00005.
 - 3] Counter coil (CU15) is turned on since the progress value \geq set value.
 - 4] The count value will not exceed 65535 (decimal).
 - 5] The progress value and counter coil are cleared by counter clear (CL15).
- The clear is performed under the conditions set immediately prior to the execution of the counter coil instruction.

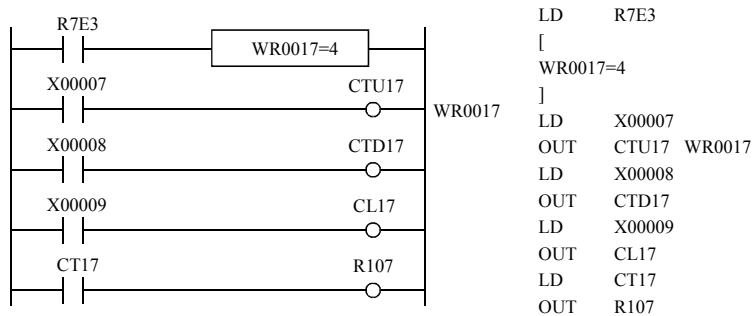

- Example using word I/O as the set value
When RUN is commenced, the set value is set to the word I/O.
Or, the word I/O for the set value is designated to store in the power failure memory.

Item number		Basic instructions-25, 26				Name		Up (CTU n) and down (CTD n) of up/down counter (UP/DOWN COUNTER)									
Ladder format				Condition code						Processing time (μs)				Remark			
				R7F4	R7F3	R7F2	R7F1	R7F0	Average	Maximum			Upper case: CTU Lower case: CTD

n	Counter number													○	0 to 255 (Decimal)		
s	Set value							○	○	○					○	1 to 65535 (Decimal)	
Function																	
Notes																	
		<ul style="list-style-type: none">For the UP counter, increments the progress value by 1 each time the leading edge of the startup condition is detected, while it decrements the progress value by 1 for the DOWN counter. The coil switches on when the progress value is greater than or equal to the set value and switches off when the progress value is less than the set value. When the counter clear CL n switches on, the progress value is cleared to 0 and the coil switches off.The progress value is set in TC n, and the value will be in the range of 0 to 65535 (decimal).If the progress value is updated during RUN, the operation will be performed using the new progress value at that point.If an I/O is set for the set value, the set value can be changed during operation by changing the I/O value, since the set values are updated during each scan.															
		<ul style="list-style-type: none">A maximum of 256 points can be used for the timers and counters TD, SS, CU, CTU and CTD in total.The timer numbers and counter numbers cannot be overlapped.The numbers for the UP coil and DOWN coil must be the same.While the counter clear CL n is on, the rise of startup condition is ignored.Since the startup condition of the counter is edge detection, the condition for one scan may not be detected during the first scan after RUN starts.If the set value is set to “0”, it is regarded as a coil that is always on and controlled by the CL n.															

Program example

- An example of a word I/O being used as the set value for the circuit shown above.

Program description

[Time chart]

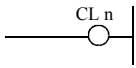

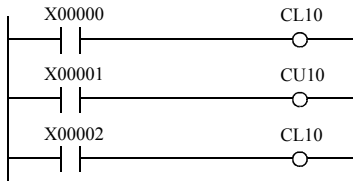

- The progress value (count value) is up-counted at the leading edge of X00007.
- The counter coil (CT17) is turned on when the progress value \geq set value.
- When the up-coil and down-coil startup conditions turn on simultaneously, the progress value does not change.
- The progress value is down-counted at the leading edge of X00008.
- The counter coil turns off when set value $>$ progress value.

- The progress value will not exceed 65535 (decimal). Also, it will not be below 0.
- When the counter clear (CL17) turns on, the progress value and the counter coil are cleared. The progress value is not updated while the counter clear is on.

- The clear is performed under the conditions set immediately before execution of the counter coil instruction.
- Example using the word I/O as the set value

When RUN is commenced, the set value is set to word I/O.

Or, the word I/O for the set value is designated to store in the power failure memory.

Program example

Program description

- 1] The value of WX0000 is substituted into WR0000 at the leading edge of input X00000.
- 2] The value of WX0000 is substituted into the WR number designated by WR0000 + WM000 at the leading edge of input X00001.
 - 1) When WM000 = H0010, it holds the same meaning as WR0010 = WX0000.
- 3] The word number of the I/O advanced by the amount designated by WR0000 + WM001 due to the I/O assignment is substituted into WR0000 at the leading edge of input X00002.
 - 1) When WM001 = H0010, it holds the same meaning as WR0000 = WR0010.
- 4] The I/O value designated by WR0000 + WM001 at the leading edge of input X00003 is substituted into the I/O of the value designated by WR0000 + WM000.

Example) When WM000 = H0010 and WM001 = H0015, it holds the same meaning as WR0010 = WR0015.

<div><div><div><div><div></div><div>31</div></div><div><div>Sign</div><div></div></div><div><div></div><div>0</div></div></div><div>s1</div><div><div><div></div><div>31</div></div><div><div>Sign</div><div></div></div><div><div></div><div>0</div></div></div><div>s2</div><div><div><div>×</div><div></div><div>63</div><div>3231</div><div></div><div>0</div></div><div><div>↑</div><div>Sign bit</div></div><div><div>d+1</div><div>d</div></div></div></div><div><div><div><div></div><div>Example) D R0031 = DR0026 S × DR0028</div></div><div><div><div><div>WR0027</div><div>WR0026</div></div><div>s1</div></div><div><div>DR0026</div><div></div></div><div><div><div>WR0029</div><div>WR0028</div></div><div>s2</div></div><div><div>DR0028</div><div></div></div><div><div>×</div><div></div><div></div></div><div><div><div><div>WR0034</div><div>WR0033</div></div><div>DR0033</div></div><div><div><div>WR0032</div><div>WR0031</div></div><div>DR0031</div></div></div></div></div></div><div><div>The sign of the operation result is entered in the most significant bit.</div><div><div><div>s1, s2</div><div>– 2147483648 to +2147483647 (decimal)</div><div>H80000000 to H7FFFFFFF (hexadecimal)</div></div></div></div></div>																	
Cautionary notes																	
<div><div><div><div></div><div>The operation result is always assigned to d and d+1. Be sure not to use word or double word d+1 as the I/O of other functions.</div></div></div></div>																	
Program example																	
<div><div><div>X00000</div><div></div><div>DR0031 = DR0026 S* DR0028</div></div></div>				<div><div><div>LD</div><div>X00000</div><div>[</div><div>DR0031 = DR0026 S* DR0028</div><div>]</div></div></div>													
Program description																	
<div><div><div><div></div><div>When input X00000 turns on, the product of the values in DR0026 and DR0028 is substituted into DR0031 as signed binary data.</div></div></div></div>																	

Item number		Arithmetic instructions-9				Name		Binary division (BINARY DIVISION)

							3										
Usable I/O				Bit				Word				Double word			Constant	Other	
				X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM			
d	I/O to be tested								○	○	○		○	○			
n	Bit location to be tested							○	○	○	○				○	The constant is set in decimal.	
Function																	
<div><div><div>• Checks the contents of the nth bit of the I/O (word or double word) specified by d, and if the result is “1,” '1' is set to C (R7F0). If the result is “0,” C (R7F0) is reset to “0.”</div><div>• The contents of d remains unaltered.</div></div><div><div><div><div><div></div><div>d</div></div><div><div><div><div><div>n+1</div><div>n</div><div>n-1</div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div><div><div><div><div>5</div><div>4</div><div>3</div><div>2</div><div>1</div><div>0</div></div></div></div></div><div><div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div></div><div><div><div></div><div>C (R7F0)</div></div></div></div></div><div><div><div>If d is a word:</div><div>Designates the bit location depending on the contents (0 to 15) of the lower 4 bits (b3 to b0) of n (WX, WY, WR, WM, TC). (Upper bits are ignored and considered as “0.”) The n (constant) can be set to 0 to 15 (decimal).</div></div><div><div><div>If d is a double word:</div><div>Designates the bit location depending on the contents (0 to 31) of the lower 5 bits (b4 to b0) of n (WX, WY, WR, WM, TC). (Upper bits are ignored and considered as “0.”) The n (constant) can be set to 0 to 31 (decimal).</div></div></div></div></div></div></div></div>																	
Program example																	
<div><div><div><div>X00000</div><div>DIF200</div></div><div><div>BSET (DR0100, WR0001)</div><div>BRES (DR0102, WR0001)</div><div>BTS (DR0104, WR0001)</div><div>R000 = R7F0</div></div></div><div><div>LD X00000</div><div>AND DIF200</div><div>[</div><div>BSET (DR0100, WR0001)</div><div>BRES (DR0102, WR0001)</div><div>BTS (DR0104, WR0001)</div><div>R000 = R7F0</div><div>]</div></div></div>																	

Program description

When WR0001 = H1234 at the leading edge of X00000 (WR0001 = 0001001000110100)
 20 (decimal)

If DR0100 = H00000000, DR0102 = HFFFFFFF and DR0104 = H5555AAAA are set, the 20th bit of DR0100 is set to “1” by the BSET at the leading edge of X00000.

b31 — b20 — b0
 DR0100=00000000000000000000000000000000
 ↑
 This bit is set to “1.”

Also, the 20th bit of DR0102 is reset to “0” by BRES.

b31 — b20 — b0
 DR0102=11111111111111111111111111111111
 ↑
 This bit is set to “0.”

Also, the 20th bit of DR0104 is checked by BTS.

b31 — b20 — b0
 DR0104=01010101010101010101010101010101
 ↑
 This bit is checked.
 Since the 20th bit is “1,” C (R7F0) = “1” is set.

Program example

Program description

- There exists a conveyor that has 16 stands and is moving to the right.
- Each time the conveyor moves one stand to the right, a pulse input enters X1.
- There is a sensor on the left end of the conveyor, and when a defective unit is placed on the conveyor, X00000 turns on. X00000 (sensor input) and X00001 (conveyor movement) signals are as follows:

- As the conveyor moves to the right, the data is also shifted one bit at a time, and when data exits to the carry (on the right end of the conveyor), the (Y00100) solenoid valve turns on and rejects the defective unit.

SHR (d, n)

Program example

Program description

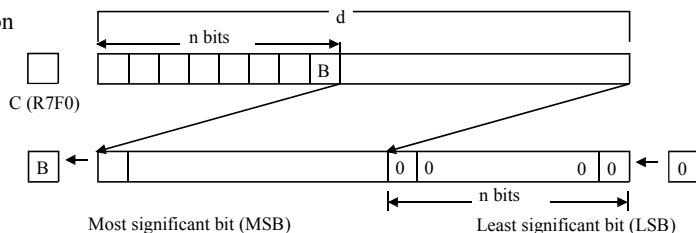

- When X00001 rises, the 64-bit data is shifted one bit at a time. The space after the shift is filled with “0.”

Overall movement

ROL (d, n)

Item number		Application instructions-8				Name		Logical shift right									
Ladder format				Condition code						Processing time (μs)				Remark

							3										
Usable I/O		Bit				Word				Double word			Constant	Other			
		X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM					
d	I/O to be shifted							○	○	○		○	○				
n	Number of bits to be shifted						○	○	○	○				○	The constant is set in decimal.		
Function																	
<ul style="list-style-type: none">Shifts the contents of d to the right (toward the lower digits) by n bits.“0” is set from the most significant bit to the nth bit.The content of the nth bit from the least significant bit is set in C (R7F0).																	
<p>Before execution</p> <p>After execution</p> <p>Most significant bit (MSB) Least significant bit (LSB)</p>																	
<p>If d is a word: Designates the shift amount, depending on the contents (0 to 15) of the lower 4 bits (b3 to b0) of n (WX, WY, WR, WM, TC). (Upper bits are ignored and considered as “0.”) The n (constant) can be set to 0 to 15 (decimal).</p> <p>If d is a double word: Designates the shift amount, depending on the contents (0 to 31) of the lower 5 bits (b4 to b0) of n (WX, WY, WR, WM, TC). (Upper bits are ignored and considered as “0.”) The n (constant) can be set to 0 to 31 (decimal).</p>																	
Notes																	
<ul style="list-style-type: none">If n is equal to “0,” the shifting is not performed. The previous state is retained in C.																	
Program example																	
										<pre>LD X00001 AND DIF1 [LSR (WR0000 ,1)]</pre>							
Program description																	
<ul style="list-style-type: none">When X00001 rises, the content of WR0000 is shifted to the right by one bit. At this time, “0” is set in b15 and the value of b0 immediately prior to the shift is set in R7F0.

Item number		Application instructions-12				Name		Block transfer (MOVE)							
Ladder format				Condition code						Processing time (μs)		Remark			
MOV (d, s, n)				R7F4	R7F3	R7F2	R7F1	R7F0	Average	Maximum	As per the table below.				
				DER	ERR	SD	V	C							
				↑	●	●	●	●							
Instruction format				Number of steps											
MOV (d, s, n)				Condition			Steps								
							4								
Usable I/O				Bit				Word				Double word		Constant	Other
				X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY		
d	Transfer destination head I/O					○			○						
s	Transfer source head I/O					○			○						
n	Number of bits (words) to be transferred						○	○	○	○				○	The constant is set in decimal.
Function															
				<div><div><div><div>•</div><div>Transfers n bits (words) between s and s + n – 1 to d + n – 1.</div></div><div><div>•</div><div>The values between s and s + n – 1 are retained. However, if the transfer source and transfer destination ranges overlap, the transferred values will be used.</div></div></div><div><div><div>Before Program example

- The data in WM000 to WM01F is transferred to the area WR020 to WR03F.

```
LD R001
AND DIF0
[
MOV (WR020,WM000,32)
]
LD R7F4
SET Y00100
```

Program description

- 32 words of data are transferred.

MOV (d, s, n)

Item number		Application instructions-13				Name		Copy									
Ladder format				Condition code						Processing time (μs)				Remark			
COPY (d, s, n)				R7F4	R7F3	R7F2	R7F1	R7F0	Average	Maximum			As per the table below.				
				DER	ERR	SD	V	C									
				↑	●	●	●	●									
Instruction format				Number of steps													
COPY (d, s, n)				Condition			Steps										
							4										
Usable I/O		Bit				Word				Double word			Constant	Other			
		X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM					
d	Copy destination head I/O				○			○									
s	Copy source head I/O		○	○	○		○	○	○	○				○			
n	Number of bits (words) to be copied						○	○	○	○				○	The constant is set in decimal.

Program example

The default value (H2020) is set in the range of WR0100 to WR01FE.

Program description

WR0100 to WR01FE is considered as the communication data area and is filled with space code (H20) as the default value during the first scan after RUN starts.
R7E3: The first scan ON after RUN

COPY (d, s, n)

Item number		Application instructions-14				Name		Block exchange (EXCHANGE)							
Ladder format				Condition code					Processing time (μs)			Remark			
XCG (d1, d2, n)				R7F4	R7F3	R7F2	R7F1	R7F0	Average	Maximum		As per the table below.			
				DER	ERR	SD	V	C							
				↑	●	●	●	●							
Instruction format				Number of steps											
XCG (d1, d2, n)				Condition			Steps								
							4								
Usable I/O		Bit				Word				Double word		Constant	Other		
		X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY			DR, DM	
d1	Exchange destination head I/O			○				○							
d2	Exchange source head I/O			○				○							
n	Number of bits (words) to be exchanged					○	○	○	○				○	The constant is set in decimal.	
Function															
<div><div><div>• Exchanges the contents of the n bits from d1 to d1 + n - 1 and the contents between d2 and d2 + n - 1.</div><div>• Bits are exchanged with bits and words are exchanged with words.</div></div><div><div><div><div><div></div><div></div><div></div><div></div><div></div></div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div></div><div></div><div></div><div></div><div></div></div> d	Number of bits set to 1								○	○						
s	I/O that counts the bits set to 1								○	○	○	○	○	○	○	
Function																
				<div>● Of the contents of s (16 bits for word and 32 bits for double word), the number of bits that are set to “1” are output to d (0 to 32).</div> <div><div><div>15</div><div>5</div><div>0</div><div>d</div><div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div><div>0 to 32</div></div><div><div>15(32)</div><div>0</div><div>s</div><div><div>...</div><div>1</div><div>...</div><div>1</div><div>1</div><div>...</div><div>1</div><div>...</div><div>1</div><div>...</div><div>1</div><div>...</div><div>1</div><div>1</div><div>1</div><div>...</div><div>1</div></div><div>Number of bits that are set to "1"</div></div></div>												
Program example																
				<div><div><div>X00002</div><div>DIF2</div><div>BCU (WR0000, DR0020)</div></div><div><div>LD X00002</div><div>AND DIF2</div><div>[</div><div>BCU (WR0000, DR0020)</div><div>]</div></div></div>												
Program description																
				<div>● At the leading edge of X00002, the number of bits that are set to “1” among the data input to DR0020 is counted, and set to WR0000.</div> <div>Example)</div> <div>In the case of</div> <div><div>DR0020 =</div><div><div>A714F153</div><div><div>1</div><div>0</div><div>1</div><div>0</div><div>0</div><div>1</div><div>1</div><div>1</div><div>0</div><div>0</div><div>0</div><div>1</div><div>0</div><div>1</div><div>0</div><div>0</div><div>1</div><div>1</div><div>1</div><div>0</div><div>0</div><div>0</div><div>1</div><div>0</div><div>1</div><div>0</div><div>1</div><div>0</div><div>0</div><div>1</div><div>1</div></div></div></div> <div>the number of bits set to "1" is 16 (decimal).</div> <div>Therefore, the result is WR0000 = H0010.</div>												

Item number	Application instructions-23				Name		Swap																							
Ladder format			Condition code					Processing time (μs)		Remark																				
SWAP (d)			R7F4	R7F3	R7F2	R7F1	R7F0	Average	Maximum																					
			DER	ERR	SD	V	C	25	—																					
			●	●	●	●	●																							
Instruction format			Number of steps																											
SWAP (d)			Condition			Steps																								
						2																								
Usable I/O			Bit				Word				Double word		Constant	Other																
			X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY			DR, DM															
d	I/O to be exchanged							○	○																					
Function																														
•			Swaps the upper 8 bits and lower 8 bits contained in d.																											
(Before execution) d			<table><tr><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td></tr></table>												0	0	0	1	1	1	0	1	0	1	1	0	1	1	0	1
0	0	0	1	1	1	0	1	0	1	1	0	1	1	0	1															
(After execution) d			<table><tr><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td></tr></table>												0	1	1	0	1	1	0	1	0	0	0	1	1	1	0	1
0	1	1	0	1	1	0	1	0	0	0	1	1	1	0	1															
Notes																														
•			Use edge trigger as the startup condition for this instruction.																											
Program example																														
<table><tr><td>X00000</td><td>DIF0</td><td>SWAP (WR0010)</td></tr></table>			X00000	DIF0	SWAP (WR0010)	<pre>LD X00000 AND DIF0 [SWAP (WR0010)]</pre>																								
X00000	DIF0	SWAP (WR0010)																												
Program description																														
•			The upper and lower bits of WR0010 are swapped at the leading edge of X00000, and are stored in WR0010.																											
			<table><tr><td>WR0010</td><td>H1234</td><td>Before execution</td></tr><tr><td>WR0010</td><td>H3412</td><td>After execution</td></tr></table>												WR0010	H1234	Before execution	WR0010	H3412	After execution										
WR0010	H1234	Before execution																												
WR0010	H3412	After execution																												
Note:			Since a scan is executed when there is no leading edge DIF0, the upper and lower bits of WR0010 are swapped every time a scan is executed.

Program example

Program description

A 3-digit BCD input display device is connected to the WY0010, and each digit displays WR0000 to WR0002 data independently. (Only the lower four bits are considered the valid data for WR0000 to WR0002.)

Program example

```

LD   X00001
AND  DIF0
[
DIST (WR0000, WX0000, 4)
]

```

Program description

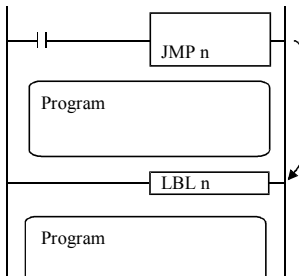

A 4-bit 4-digit Digit switch is connected to the WX0000, and the data for each digit is stored in WR0000 to WR0003 as independent data.

Item number	Control instructions-1				Name		Normal scan end									
Ladder format			Condition code							Processing time (μs)			Remark			
END			R7F4	R7F3	R7F2	R7F1	R7F0	Average	Maximum		714		—			
			DER	ERR	SD	V	C

Function																
<ul style="list-style-type: none">Indicates the end of a normal scan program. (The execution of this instruction returns to the beginning of the program, and a normal scan is executed.)This instruction is not required when there are no subroutine programs or interrupt scan programs.If there is a subroutine program or interrupting program, write this instruction at the end of the normal scan program.This instruction is used only once in a program. Do not use any startup conditions with this instruction.																
Notes																
<ul style="list-style-type: none">The END instruction is checked prior to the execution, and if there is an error, the following error codes are set in the special internal output WRF001. Also, the CPU error code '34' is set to special internal output WRF000.																
CPU error code		Special internal output				Error code		Error description								
34		WRF001				H0010		There is no END instruction.								
						H0022		There are two or more END instructions.								
						H0032		A startup condition is used with the END instruction.								
Instruction for use																
<p>The diagram illustrates the execution flow of a ladder logic program. It shows a vertical line representing the program structure. On the left, there are three horizontal rungs. The first rung contains a normally open contact and a coil labeled 'END'. The second rung contains a coil labeled 'SB n'. The third rung contains a coil labeled 'INT n'. Arrows indicate the flow of execution: from the top rung to the second, then to the third, and finally down to the 'Subroutine program' section. From the 'Subroutine program' section, an arrow points down to the 'Interrupt program' section. The 'END instruction' is specifically labeled with an arrow pointing to the 'END' coil in the first rung.</p>

		<div><div><div>R 01</div><div>CJMP n (R000)</div><div>Program</div><div>LBL n</div><div>Program</div></div><div><ul style="list-style-type: none">• When the startup condition and the R000 jump condition bit I/O are both on, it jumps to LBL n.• If there is a timer within the program it jumped to, the progress value is updated, but since instructions are not executed, output will not be turned on even if the ON conditions are met.</div></div>																							

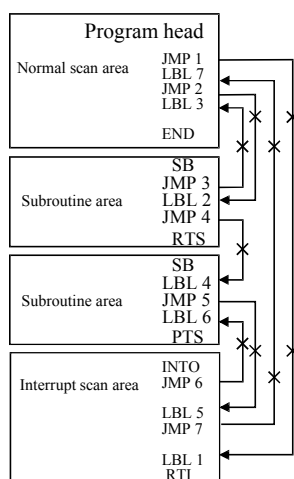

Syntax of JMP, CJMP

- 1] LBL n with the same code number as the code number n of the JMP instruction is required.

- If JMP 1 is executed when there is no LBL 1, an LBL undefined error occurs. JMP 1 will do nothing and execute the next processing of program A.

- 2] Jump is not permitted to outside the area in which the JMP instruction resides.

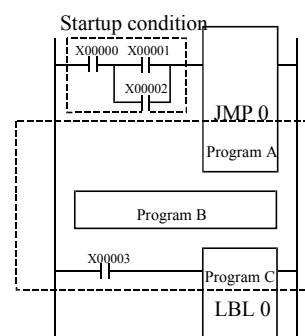

- When the JMP 1 instruction is executed, since LBL 1 is not in the normal scan area, a "jump outside the area" error will be generated. The JMP 1 instruction will do nothing and execute the next processing of program.
- JMP 2 to JMP 7 perform similar processing.

- 6] An overlap of JMP instructions with the same code number is valid.

- 7] A startup condition can be programmed with respect to JMP instructions.

- If a jump is performed from JMP 0 to LBL 0, programs A, B and C will not be executed.

- 8] The CJMP instruction also follows the same syntax as 1] through 7].

Note 1: When a JMP instruction jumps to LBL, the status of each I/O between JMP and LBL is retained. However, the timer progress value will be updated.

- In the pre-operation process, the label instructions A] and B] have 5 as the code numbers, so a duplicate definition error will occur.

- 4] Nesting of JMP instructions is allowed.

- 5] The JMP instruction can jump to a location before the instruction itself.

- JMP 0 will jump to LBL 0, which is a location before the JMP instruction.
- When input X00000 turns on, the loop between LBL 0 and JMP 0 is escaped by jumping from CJMP 1 (X00000) to LBL 1.
- If there is no instruction as CJMP 1 (X00000) to escape from the loop, the loop from LBL 0 to JMP 0 will continue endlessly.

- If X00000 turns on after X00001 turns on, the progress value of TD0 will be updated even if a jump is performed from JMP 1 to LBL 1. If X00000 remains on, TD0 will not turn on even if its progress value exceeds 100.

Note 2: If the JMP instruction is used in conjunction with the MCS or MCR instruction, the following actions will result, so exercise caution when programming.

- When JMP 2 does not jump, Y00100 will turn on when X00001 and X00002 are both on.
- When JMP 2 does jump, if X00000 is on, Y00100 will follow the on/off of X00002 regardless of the on/off of X00001.

Note 3: Do not create a circuit that jumps to outside from between MCS and MCR.

Syntax of FOR to NEXT

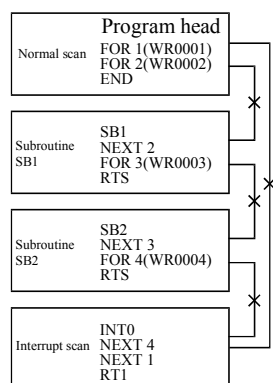

- 1] A NEXT instruction with the same code number as the code number n of the FOR instruction is required after the FOR instruction.

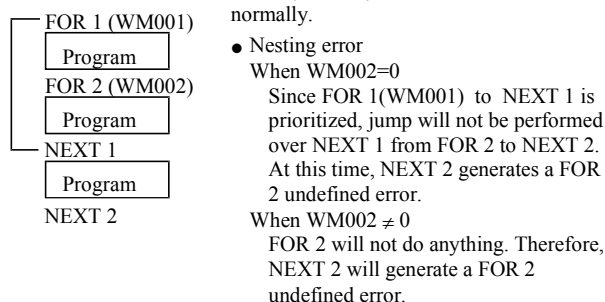

- 2] An overlap of FOR and NEXT instructions with the same code number n is not allowed.

- 3] FOR and NEXT must be within the same area.

- 4] Use FOR to NEXT as a nest.

- 5] It is possible to escape from a FOR to NEXT loop using a jump instruction.

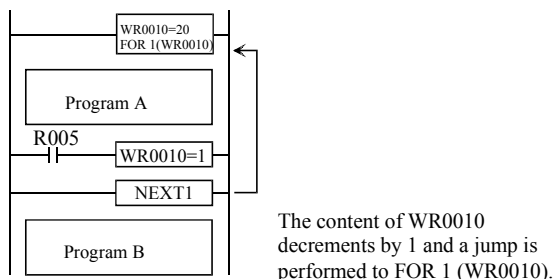

- 6] FOR to NEXT may be nested up to 5 levels. When a subroutine is included, the FOR to NEXT within the subroutine is counted.

- 7] Do not include a startup condition between FOR and NEXT. If a startup condition is required, create a circuit as shown below:

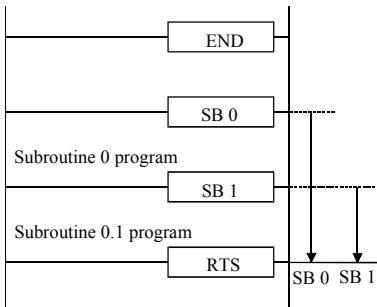

- 8] The number of repeats may be modified within the program.

- When R005 is off
Program B is executed after program A is repeated 20 times.
- When R005 is on
The repeat counter WR0010 changes to 1, and since the NEXT 1 processing subtracts 1 from it, the content of WR0010 becomes 0. Therefore, the repeating of program A is terminated and program B is executed.

Syntax of SB n, RTS, INT n and RTI

- 1] A subroutine can be programmed between a normal scan and interrupt scan, between two interrupt scans, or after the final interrupt scan.

- 2] Program the subroutine start (SB n) and subroutine end (RTS) instructions without specifying startup conditions.

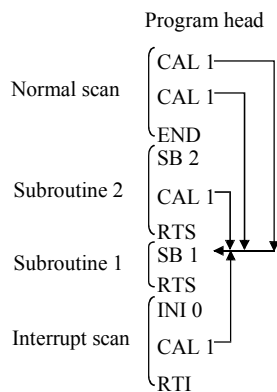

- The RTS startup condition error will occur during operation pre-processing.

- 3] Program the interrupt scan start (INT n) and scan complete (RTI) instructions without specifying startup conditions.

- 4] The same subroutine can be called from a normal scan, interrupt scan or subroutine.

- 5] It is also possible to program a subroutine with multiple entry points and one exit.

- 6] It is also possible to program an interrupt scan with many entry points and one exit.

- 7] Nesting of subroutines is allowed up to 5 levels.

HFFFF</div></div></div></div>																			

- [3] Address of sending area :
Address number and address type are configured in 2 words as below.

- [4] Reserved data size for data sending. : This is not actual data size but reserved size. Set it by "Word".

- [5] Address of receiving area :
Address number and address type are configured in 2 words as below.
(Data format is as same as sending area.)

- [6] Reserved data size for data receiving. : This is not actual data size but reserved size. Set it by "Word".

- [7]^{*1} Receiving data length :
If receiving data is found by data length, set this parameter by "Byte". The maximum size is 1,024 byte. If data is more than 1,024 bytes or reserved area, TRNS command fails with DER="1".

- [8]^{*1} Start code :
If receiving data is found by start code, set this parameter.

- [9]^{*1} End code :
If receiving data is found by end code, set this parameter.

- [10] Communication speed :

Baud rate	Value
300 bps	H0000
600 bps	H0001
1,200 bps	H0002
2,400 bps	H0003
4,800 bps	H0004
9,600 bps	H0005
19,200 bps	H0006
38,400 bps	H0007
57,600 bps	H0008

- [11] Communication format

Format	Value
7 bits, even parity, 2 stop	H0000
7 bits, odd parity, 2 stop	H0001
7 bits, even parity, 1 stop	H0002
7 bits, odd parity, 1 stop	H0003
8 bits, non parity, 2 stop	H0004
8 bits, non parity, 1 stop	H0005
8 bits, even parity, 1 stop	H0006
8 bits, odd parity, 1 stop	H0007

*1 Received data is defined by either of following 4 ways depending on setting in [7] s+A to [9] s+C.

(a) Start code and data size *2

s+A : Data length (Byte)
s+B : H80□□ (□□=Start code)
s+C : H0000

(b) Start and end code *2

s+A : H0000
s+B : H80□□ (□□=Start code)
s+C : H80□□ (□□=End code)

(c) End code

s+A : H0000
s+B : H0000
s+C : H80□□ (□□=End code)

(d) Data length

s+A : Data length (Byte)
s+B : H0000
s+C : H0000

*2 In case of start code used, CPU can fail to receive due to buffer size full if data with wrong start code is sent.

(6) "t" parameter

- [0] Execution bit:
Set "1" by user program to send data. This bit is reset after communication completed.
- [1] Communication completed :
This bit is set "1" when communication completed without error, and reset at communication starting.
- [2] Communication failed :
This bit is set "1" when communication fails, and reset at communication starting.
- [3] Initialize :
Set "1" by user program to initialize TRNS 0 command. If this bit is on while communication, the communication is forced to be stopped.
- [4] Initialize completed :
This bit is set "1" when initializing completed without error. Initialize bit [3] is reset at this timing.
- [5] Receive enabled :
Set "1" by user program if CPU needs to receive data after data sending. This bit is reset after communication completed.
- [6] Parity error flag :
This bit is set "1" when parity error detected.
- [7] Framing error :
This bit is set "1" when framing error detected.
- [8] Overrun error :
This bit is set "1" when overrun error detected.

- [9] Timeout :
This bit is set "1" when timeout detected.
- [A] Input buffer full :
This bit is set "1" when input buffer full
- [B] Conflict error :
This bit is set "1" when TRNS 0 or RECV 0 commands are duplicated.
- Bit [6] to [B] is reset at initializing and TRNS 0 executed.

(7) Sending/receiving data format

Set sending data as follows, and Receiving data is set as follows.

[1] Sending/receiving data byte is even.

Sending/Receiving data byte (N)	
1 st byte	2 nd byte
3 rd byte	4 th byte
5 th byte	6 th byte
7 th byte	8 th byte
...	
N-1 th byte	N th byte

[2] Sending/receiving data byte is odd.

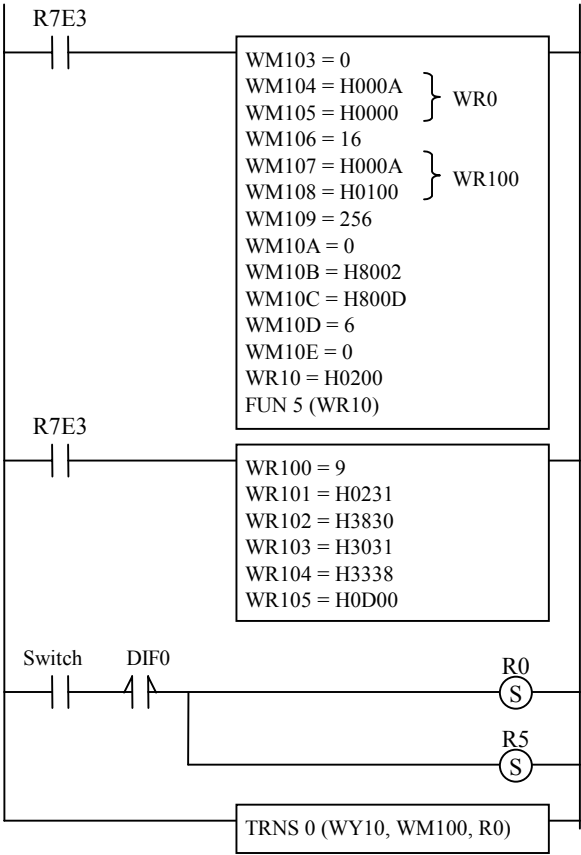

Sending/Receiving byte (N)	
1 st byte	2 nd byte
3 rd byte	4 th byte
5 th byte	6 th byte
7 th byte	8 th byte
...	
N-2 th byte	N-1 th byte
N th byte	(ignored)

Reserve area
for data
sending/receiving

Caution

- Be sure to switch port type at first from dedicated port to general purpose port by FUN 5 command in user program.
- If CPU receives data by RECV command after data sending, received data could be failed depending on timing. In such a case, TRNS command with "receive enabled" is recommended.
- No contact nor condition is allowed to use with TRNS 0 command.
- Be sure to set [0] Execution bit high in 2nd scan or later. (Not in 1st scan)
- If parameter setting is wrong, error code H52 (TRNS/RECV command error) is set in WRF000 in some cases.
- ER signal is set on in the following condition.
Communication executed properly.
- ER signal is set off in the following condition.
 - Initialized bit being set "1" while communication.
 - CPU status changed RUN→STOP→RUN while communication
 - Timeout while communication.
 - s, t parameters overwritten and range error while communication.

Sample program

R7E3 : 1st scan ON
Timeout = 0

Reserve area for data sending :
16 words from WR0

Reserve area for data receiving :
256 words from WR100

Data receiving definition
Start code : H02, End code : H0D

Communication speed : 19.2k bps
Format : 7 bits, even, 2 stop

Port 2 configured as general purpose port.

Sent data : 9 bytes
Inverter (SJ300/L300P) command
FWD RUN for station No.18
02 31 38 30 30 31 33 38 0D
(STX 18 00 1 38 CR) [38=BCC]

When the switch is ON, execution bit R0 is ON, and data is sent out from CPU port.

R5 enables data receiving from the other device.

Description

TRNS 0 parameter and sent data are configured at 1st scan by R7E3 contact.
When the switch is ON, execution bit R0 is ON, and data is sent out from CPU port.

TRNS 0 (d, s, t)

TRNS/RCV command return code table

Return code	Name	Description	Countermeasure
H00	Completed properly	Operation completed without error	-
H21	Range error	Parameter "s" and "t" is out of available I/O range.	Set right value.
H22	Reserve area for sending setting error	Parameter setting is wrong.	
H23	Reserve area for sending range error	Parameter is out of available I/O range.	
H24	Reserve area for receiving setting error	Parameter setting is wrong.	
H25	Reserve area for receiving range error	Parameter is out of available I/O range.	
H26	Sending data error	Configured sending data length is beyond reserve area	
H27	Receiving data error	Configured receiving data length is beyond reserve area	
H28	Area overlapping error *2	Parameter s, t, or reserve area is overlapped.	
H30	Timeout *1	Communication is not completed within configured time.	Set longer timeout or check the program.
H40	Receiving area over *3	Received data is beyond reserved area	Configure bigger size
H41	Parity error *4	Parity error detected	Check wiring and data format.
H42	Framing error *4	Framing error detected	
H43	Overrun error detected	Overrun error detected	
H44	Conflict error	TRNS 0/RCV 0 duplicated	Execute one by one
H45	Parameter error	Baud rate or format setting is wrong	Set right value.
H46	Port type error	Port type is not general purpose port.	Configure general purpose port.

*2 Area overlapping error (H28) is not detected in the following case.

If starting area of "s" parameter and "t" parameter is overlapped, error code H21 can be set instead of H28.

*3 Received data is stored as long as reserved area. (1,024 bytes)

*4 Data is not guaranteed.

Item number		Transfer command-2				Name		General purpose port communication command									
Ladder format						Condition code					Processing time (μs)			Remark			
RECV 0 (d, s, t)						R7F4	R7F3	R7F2	R7F1	R7F0	Average		Maximum

						↕	●	●	●	●							
Command format						Number of steps					80		2,064				
RECV 0 (d, s, t)						Condition			Steps								
						-			5								
Usable I/O				Bit				Word				Double word			Constant	Others	
				X	Y	R, L, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM			
d	Dummy								○								
s	Parameter area									○							s to s+14
t	Communication control							○									t to t+11
Function																	
<div><div>(1) This is a command to send data via general purpose port. It is also possible to receive data after data sending.</div><div>(2) Parameter "d" is dummy. Assign WX0. (Actual data in X00 to X15 is not influenced.)</div><div>(3) Parameter "s" is starting address of parameter table for communication setting.</div><div>(4) Parameter "t" is starting address of bit table for communication control.</div><div>(5) "s" parameter</div><div><div><div><div>s</div><div>[0] Return code</div></div><div><div>s+1</div><div>[1] System area (Do not use this area.)</div></div><div><div>s+3</div><div>[2] Timeout</div></div><div><div>s+4</div><div>[3] Address of sending area</div></div><div><div>s+6</div><div>[4] Reserve area for data sending (word)</div></div><div><div>s+7</div><div>[5] Address of receiving area</div></div><div><div>s+9</div><div>[6] Reserve area for data receiving (word)</div></div><div><div>s+A</div><div>[7] Receiving data length (byte)</div></div><div><div>s+B</div><div>[8] Start code</div></div><div><div>s+C</div><div>[9] End code</div></div><div><div>s+D</div><div>[10] Communication speed</div></div><div><div>s+E</div><div>[11] Communication format</div></div></div><div><div>[0] Return code :</div><div>Result of RECV 0 command is set in lower 8 bits. Completed 0 Error ≠ 0</div></div><div><div>[1] System area :</div><div>This area is used by system (CPU) while RECV 0 operation. <u>It is not allowed for users to use this area.</u></div></div><div><div>[2] Timeout :</div><div>Timeout setting from command executed to completed. =0 : Timeout disabled ≠0 : Timeout enabled [×10ms] Max. HFFFF</div></div><div><div><div></div><div>: Access forbidden</div></div><div><div></div><div>: User setting area</div></div></div></div></div>																	

- [3] Address of sending area :
Address number and address type are configured in 2 words as below.

- [4] Reserved data size for data sending. : This is not actual data size but reserved size. Set it by "Word".
- [5] Address of receiving area :
Address number and address type are configured in 2 words as below.
(Data format is as same as sending area.)
- [6] Reserved data size for data receiving. : This is not actual data size but reserved size. Set it by "Word".
- [7]^{*1} Receiving data length :
If receiving data is found by data length, set this parameter by "Byte". The maximum size is 1,024 byte. If data is more than 1,024 bytes or reserved area, RECV command fails with DER="1".
- [8]^{*1} Start code :
If receiving data is found by start code, set this parameter. (See TRNS command)
- [9]^{*1} End code :
If receiving data is found by end code, set this parameter. (See TRNS command)
- [10] Communication speed (See TRNS command)
- [11] Communication format (See TRNS command)

*1 Received data is defined by either of following 4 ways depending on setting in [7] s+A to [9] s+C.

*2 In case of start code used, CPU can fail to receive due to buffer size full if data with wrong start code is sent.

(6) "t" parameter

- [0] Execution bit:
Set "1" by user program to send data. This bit is reset after communication completed.
- [1] Communication completed :
This bit is set "1" when communication completed without error, and reset at communication starting.
- [2] Communication failed :
This bit is set "1" when communication fails, and reset at communication starting.
- [3] Initialize :
Set "1" by user program to initialize RECV 0 command. If this bit is on while communication, the communication is forced to be stopped.
- [4] Initialize completed :
This bit is set "1" when initializing completed without error. Initialize bit [3] is reset at this timing.
- [5] Send enabled :
Set "1" by user program if CPU needs to send data after data receiving. This bit is reset after communication completed.
- [6] Parity error flag :
This bit is set "1" when parity error detected.
- [7] Framing error :
This bit is set "1" when framing error detected.
- [8] Overrun error :
This bit is set "1" when overrun error detected.
- [9] Timeout :
This bit is set "1" when timeout detected.
- [A] Input buffer full :
This bit is set "1" when input buffer full
- [B] Conflict error :
This bit is set "1" when TRNS 0 or RECV 0 commands are duplicated.
- Bit [6] to [B] is reset at initializing and RECV 0 executed.

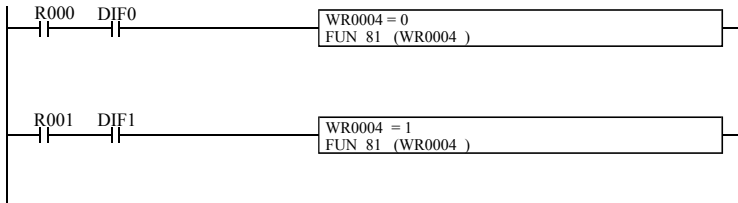

(7) Sending/receiving data format (See TRNS 0 command)

Caution

- Be sure to switch port type at first from dedicated port to general purpose port by FUN 5 command in user program.
- If CPU receives data by RECV command after data sending, sent data could be failed depending on timing. In such a case, RECV command with "send enabled" is recommended.
- No contact nor condition is allowed to use with RECV 0 command.
- Be sure to set [0] Execution bit high in 2nd scan or later. (Not in 1st scan)
- If parameter setting is wrong, error code H52 (TRNS/RECV command error) is set in WRF000 in some cases.
- ER signal is set on in the following condition.
Communication executed properly.
- ER signal is set off in the following condition.
 - Initialized bit being set "1" while communication.
 - CPU status changed RUN→STOP→RUN while communication
 - Timeout while communication.
 - s, t parameters overwritten and range error while communication.

Item number		FUN instructions-1				Name		General purpose port switching

Program description														
		<div><div><div>• Upon leading of R000, the two slots designated after WR0001 (unit 0, slot 0) and (unit 1, slot 0) are refreshed.</div></div></div>												

Notes

- Set the unit number (0 to 3) and slot number (0 to 1) after s+1. For other set values, DER is set to “1” and that slot will not be processed.
- If there is no I/O assignment to the designated slot, DER is set to “1” and that slot will not be processed.
- If the number of s+n points exceeds the maximum I/O number, DER is set to “1” and no processing will be performed.
- If the number of points exceeds 64, DER is set to “1” and the points exceeding 64 will not be processed (refresh will be performed for up to 64 points).

Slot location number
The slot locations are designated using the unit number and slot number.
The unit number and slot number are set as follows in one word units:

b15	b12	b7	b3	b0
0 to 0	0 to 0	Unit number	Slot number	

Item number		FUN instructions-5				Name		High-speed Counter Operation Control

Program example

```
LD  R6
AND DIF6
[
WR60 = H100
WR61 = 5000
WR62 = 10000
FUN 146 ( WR60 )
]
```

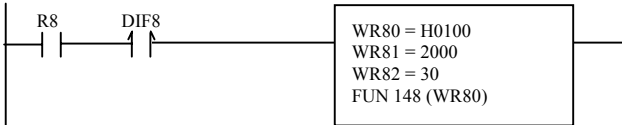

Program description

- Sets both the on-preset value and off-preset value in the counter No. 1.
Sets 5000 for the on-preset value and 10000 for the off-preset value.

FUN 146 (s)

Item number		FUN instructions-12				Name		PWM operation control							
Ladder format				Condition code					Processing time (μs)			Remark

				DER	ERR	SD	V	C	135	—					
				↑	●	●	●	●							
Instruction format				Number of steps											
FUN 147 (s)				Condition			Steps								
				—			3								
Usable I/O				Bit			Word			Double word		Constant	Other		
				X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC				DX
s	Argument (PWM output number)								○						
Function															
S				15 8 7		0		PWM output number: H01 to H04 Operation instruction: H00 – Stop, H01 - Start							
				PWM output number		Operation instruction									
• Starts/stops the PWM output of the specified PWM output number.															
Notes															
• If a value other than H01 to H04 is specified as the PWM output number, DER will be set to “1” and no processing will be performed.															
• If the external I/O corresponding to the PWM output number is set to a function other than PWM output, DER will be set to “1” and no processing will be performed.															
• If PWM output is activated with this instruction, the output control flag (R7FC to R7FF) corresponding to the specified PWM output number will turn on and off.															
• The PWM output operation does not stop, even when CPU operation is stopped.															
• When the CPU is not operating, the PWM output continues/stops according to the setting of the special internal output (output selection at R7DC stop).															
Program example															
<div><div><div><div>R7</div><div>DIF7</div></div><div><div>WR7 = H0101 FUN 147 (WR7)</div></div></div></div>				<div><div>LD R7</div><div>AND DIF7</div><div>[</div><div>WR7 = H101</div><div>FUN 147 (WR7)</div><div>]</div></div>											
Program description															
• Prior to starting a PWM output operation, various settings required for the PWM output operation are reflected in the special internal outputs, and the PI/O function setting flag (R7F5) is turned on while the CPU is being stopped. For details on the special internal output settings, see Chapter 8. Starts the PWM output No. 1 (Y100) operation.

Notes

- If the pulse output number is set to a value other than H01 to H04, DER will be set to “1” and no processing will be performed.
- If the external I/O corresponding to the pulse output number is set to a function other than pulse output, DER will be set to “1” and no processing will be performed.
- The minimum frequency that can be supported is 10 kHz. If a frequency value smaller than 10 kHz is specified, it will be changed to 10 kHz internally by the system.
- If the specified frequency value is greater than 5 kHz, or even when it is 5 kHz or less, and if the total sum with other set pulse output frequencies becomes greater than 5 kHz, DER will be set to “1” and no processing will be performed.
- If the specified frequency value is 5 kHz or less, and the total sum with other set pulse output frequencies is also 5 kHz or less, the bit corresponding to the setting error detail WRF057 will be set to “0” and the operation enable state becomes active.
- The settings by this instruction will be reflected in the special internal output (WRF072 to WRF075 and WRF07A to WRF07D).
- If the range for S exceeds the valid range of the I/O, DER will be set to “1” and no processing will be performed.
- If the pulse output number is set to “0,” pulse output will not be performed even when the pulse output start (R7FC to R7FF) is set to “1” or FUN149) is set.
- If this instruction is executed for the I/O that is outputting a pulse with the acceleration/deceleration function, DER will be set to “1” and no processing will be performed.

Program example

```

LD    R10
AND   DIF10
[
  WR100 = H100
  WR101 = 219
  WR102 = 1000
  FUN   150 ( WR100 )
]

```

Program description

- Sets both the frequency and pulse output count of the pulse output No. 1 (Y100).
Sets 500 (Hz) for the frequency and 3,000 for the number of pulse outputs.

Item number	FUN instructions-16	Name					Pulse output with acceleration/deceleration

s+4	Acceleration/deceleration time (ms)							○									
Function																	
s	Pulse output No.	15	8	7	0												
s+1	Total No. of output pulses N																
s+2	Maximum frequency F (Hz)																
s+3	Initial frequency F ₀ (Hz)																
s+4	Acceleration/deceleration time T (ms)																
<p>Pulse output No.: H01 to H04 **: Invalid area Total No. of output pulses: H0000 to HFFFF (0 to 65535) Maximum frequency (Hz): HA to H1388 (10 to 5000) Initial frequency (Hz): HA to H1388 (10 to 5000) Acceleration/deceleration time (ms): H0000 to HFFFF (0 to 65535)</p> <p>This instruction outputs pulses with the acceleration/deceleration function. It outputs pulses from the pulse output terminal set with the pulse output number s until the total number of output pulses set with s+1 is reached. Since the output of pulses starts from the one having the frequency set with s+3, set the parameters so that the stepping motor and other devices will not become out of tune. Acceleration is performed at the acceleration time set with s+4 in 10 steps until the maximum frequency set with s+2 is reached. Deceleration is performed at the deceleration time set with s+4 until the total number of output pulses set with s+1 is reached. The ratio of frequency change for the deceleration is the same as for the acceleration.</p>																	
<p>Pulse frequency (Hz)</p> <p>Time (sec)</p>																	

Notes

When this instruction is executed, the maximum frequency is stored in the special internal output's pulse output frequency (WRF072 to WRF075), and the number of output pulses is stored in the special internal output's number of output pulses (WRF07A to WRF07D) respectively.

This instruction will not be executed if the specified pulse output is generating pulse output.

If the output that corresponds to the specified pulse output number has not been set for pulse output, DER will be set to "1" and pulse output will not be generated.

If the total of the frequency set with this instruction and the frequency set for another pulse output exceeds 5 kHz, DER will be set to "1" and pulse output will not be generated.

If the maximum frequency is larger than the initial frequency, DER will be set to "1" and pulse output will not be generated.

If the same value is specified for the maximum frequency and initial frequency, pulses will be output for the number of pulses set with the maximum cycle without acceleration/deceleration.

If the maximum frequency and initial frequency are set to a value smaller than 10 Hz, the specified values will be changed to 10 Hz by the system.

If the total number of output pulses is small, deceleration will be performed without accelerating up to the maximum frequency.

In this case, the specified acceleration/deceleration time will not be used as the acceleration/deceleration time; it will be accelerated (or decelerated) for each pulse.

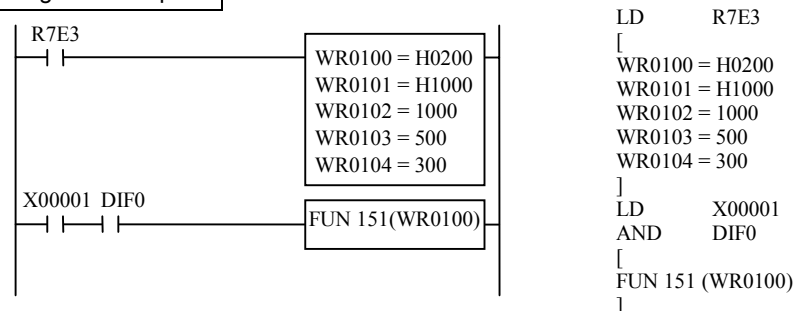

For the acceleration/deceleration time, set a value equal to or larger than $(1 / \text{maximum frequency} + 1 / \text{initial frequency}) \times 5$. If an acceleration/deceleration time smaller than this value is specified, the specified acceleration/deceleration will not be set.

Acceleration and deceleration are performed in 10 steps, and at least one or more pulses are always output. Thus, if a small initial frequency value is specified, an error in the acceleration/deceleration time will become large.

- If this instruction is executed while the backup memory is being written (R7EF=1), DER will be set to "1" and no processing will be performed.
- The backup memory will not be written during pulse output. Be extremely careful when you change a program during RUN.

Program example

Program description

Sets the required parameters in the special internal outputs at the first scan after RUN start.

At the leading edge of X00001, pulses are output starting from Y101 using the following settings: acceleration/deceleration time of 300 (Hz), initial frequency of 500 (Hz), maximum frequency of 1000 (Hz), and number of output pulses of 4,096 pulses.

			-	WY406-407 (WY405 is for command function under development)		

6.2 External I/O Numbers

When starting an operation of the MICRO-EH, a user program is executed (scanned) after the input refresh processing (receiving external input data) is performed. Operations are performed according to the contents of the user program, and the next input refresh processing and output refresh processing (operation results are reflected in the external output) are performed. After that, the next user program is executed (scanned). This series of operations is continually repeated until the operation is stopped or until a problem occurs in which the operation can no longer continue.

When the operation is stopped or if a problem interrupting the operation occurs, the CPU performs output refresh processing making all output data as off data and then stops the operation, regardless of the execution status of the user program.

Figure 6.1 shows a diagram outlining this series of operations.

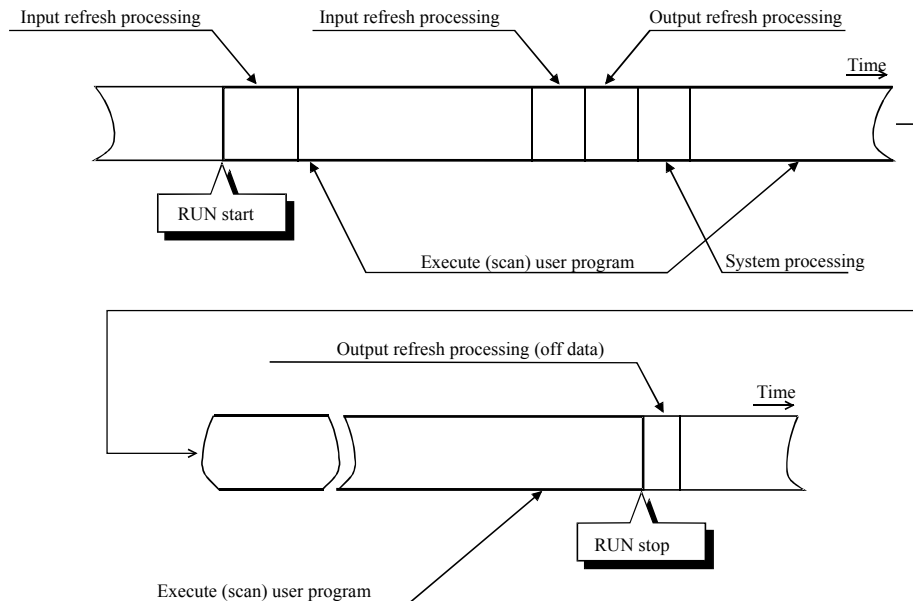

Figure 6.1 Overview of user program execution and refresh processing

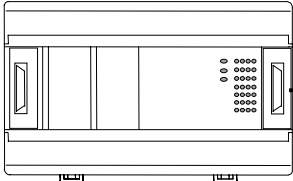

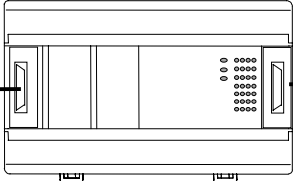

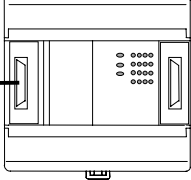

The user programs are executed in sequence, normally beginning with the program in the beginning of the scan area till the last program, or until the END instruction. Then, I/O data is refreshed prior to the execution of the next user program. As shown above, external I/O data is updated in batch mode in the refresh processing after the user program is executed. If it is necessary to update (refresh) the I/O data while the user program is being executed, use the refresh instruction. When designing a system, take into account the above refresh operation from when the input data is received and operated until output data is obtained.

The following explains the external I/O assignment. The external I/O numbers for the MICRO-EH system are expressed with the following conventions.

Table 6.6 List of external I/O classification and data type

Classification	I/O classification	Data type	Remarks
X	External input	Bit type	Corresponds to the signal of each terminal block.
WX		Word type (16-bit)	Data in the range 0 to 15 is batch processed. 16-bit synchronicity guaranteed.
DX		Double-word type (32-bit)	Two word data are batch expressed. Lower 16-bit and upper 16-bit synchronicity are not guaranteed.
Y	External output	Bit type	Corresponds to the signal of each terminal block.
WY		Word type (16-bit)	Data in the range 0 to 15 is batch processed. 16-bit synchronicity guaranteed.
DY		Double-word type (32-bit)	Two word data are expressed as one batch. Lower 16-bit and upper 16-bit synchronicity are not guaranteed.

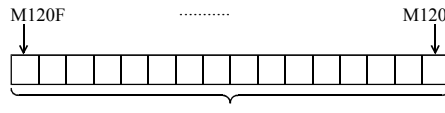

Table 6.7 List of I/O number conventions for external I/O

Data type	Numbering convention	Example
Bit type (basic)	<p>X <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> ← Input</p> <p>Y <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> ← Output</p> <p>↑ ↑ ↑ ↑ Bit number</p> <p>Slot number (X:0 Y:1)</p> <p>Unit number (0)</p>	<p>EH-A23DRP</p> <p>X0~X12, WX30, WX31</p>  <p>Y100~Y109, WY40</p>
Bit type (expansion)	<p>X <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> ← Input</p> <p>Y <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> ← Output</p> <p>↑ ↑ ↑ ↑ Bit number</p> <p>(X:00-07/15 Y:16-21/27)</p> <p>Slot number (0)</p> <p>Unit number (1-4)</p>	<p>EH-A28EDR</p> <p>X1000~X1015</p>  <p>Y1016~Y1021</p>
Word type (basic/expansion)	<p>WX <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/></p> <p>WY <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/></p> <p>↑ ↑ ↑ ↑ Word number</p> <p>Slot number</p> <p>Unit number (1-4)</p>	<p>EH-A6EAN (Analog exp.)</p> <p>WX201~WX204</p>  <p>WY206, WY207</p>

6.3 Internal Output Numbers

Memory is available as an internal output area in the CPU module. There are three areas: bit dedicated area (R), word dedicated area (WR), and bit/word shared area (M/WM).

Table 6.8 List of I/O number conventions for external I/O

Data type	Numbering convention	Example
Bit-dedicated type	R  Normal area H000 to H7BF Special area H7C0 to H7FF Both are expressed as hexadecimals.	R0 R105 R23C R7E7
Word dedicated type	<Word> WR  Normal area H0000 to Special area HF000 to Both are expressed as hexadecimals.	WR0 WR11 WR123 WRF004
	<Double word> DR  Normal area H0000 to Special area HF000 to Both are expressed as hexadecimals. Expresses WR for 2 words in continuation.	DR0 DR11 DR123 DRF004
Bit/word shared type	<Bit> M  H0000~	M0 M11 M123
	<Word> WM  H000~  WM120	WM0 WM11 WM123
	<Double word> DM  H0000 to Expresses as hexadecimals. Expresses DM for 2 words in continuation.	DM0 DM11 DM234

- Internal outputs R, WR and DR are completely separate areas. Bit-based operations cannot be performed in the WR. (Example) Relationships among R100, WR10, and DR10

- Because internal outputs M, WM and DM share the same area, bit-based operations are allowed. (Example) Relationships among M100, WM10, and DM10

Chapter 7 Programming

7.1 Memory Size and Memory Assignment

Table 7.1. Lists the programming specifications for the MICRO-EH.

Table 7.1 Programming specifications

No.	Item		10/14-point type	23/28-point type
1	Program size		3 k steps (3072 steps)	
2	Instruction size		32 bits/1 step	
3	Memory specification	SRAM	Backup with a battery is not possible since a battery cannot be installed.	Backup is possible by installing the battery.
		FLASH	Backup using flash memory is possible.	
4	Programming language		H-series ladder/instruction language	
5	Program creation		Created with H-series programming devices	
6	Program modification	During STOP	Can be done as desired from the programming devices.	
		During RUN	Can be done using the modify during RUN operation (except control instructions). Control instructions can be changed with special operations. *1 (When a change is made during RUN, control operation stops while the program is being modified.).	
7	Program protection		Programs can only be modified when write is enabled. (The enable status is automatically controlled by the programming device).	
8	Password		A password can be set from the programming device (the program cannot be displayed when setting the password. The programs can be downloaded to the programming device).	
9	Check function		A sum check function for the program is always executing. An address check with the I/O assignment table is executed when RUN operation starts.	
10	Program name		The program names are set from the programming device and stored along with the programs.	

*1: Refer to the peripheral unit manual for details.

Notes:

- Comment data that has been created with the peripheral unit is not stored in the CPU.
- Save the user programs to a floppy disk or other media for backup.
- If a program exceeding 3072 steps is created by setting 4 K steps in the LADDER EDITOR, no error occurs in the LADDER EDITOR, but a “writing outside memory range” error will occur when writing the program to the CPU.
- Unlike the conventional H series, the MICRO-EH series backup user programs in the FLASH memory.
In order to shorten the program transfer time, the user programs are transferred once to the operation execution memory, at which point the transfer is completed. The backup to the FLASH memory is performed afterward; therefore, be sure to turn off the power to the main unit after approximately two minutes have passed since the program transfer. If the power is turned off within two minutes, a user memory error (31H) may occur. Note that the transfer completion to the FLASH memory can be confirmed by the special internal output (R7EF).

7.2 Programming Devices

The following methods are used to create the user programs.

Table 7.2 Programming methods

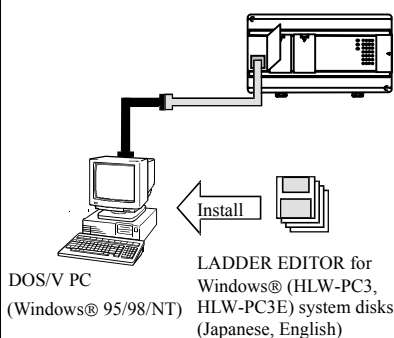

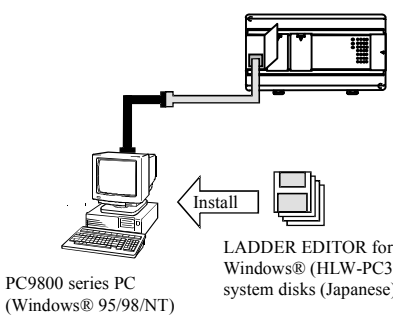

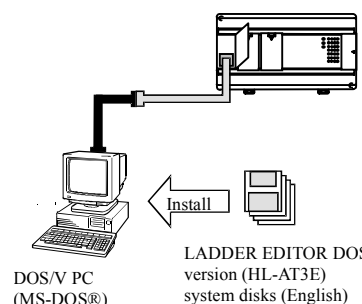

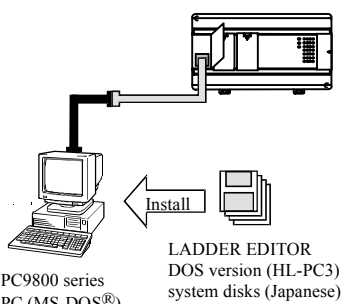

No.	Programming device used	Concept of operation	Remarks
1	Personal computer software (LADDER EDITOR, etc.)	<p>[For off-line/on-line operation] Creates an I/O assignment table, inputs the program to be created, and transfers the program to the CPU in online mode.</p> <p>[For direct operation] As each program is entered one by one, it is directly written to the CPU. Change operation can be performed during RUN operation. Note: This mode is not available for Windows® version.</p> <p>[During on-direct operation] When programs are input one by one, the input programs are written into the CPU's memory and personal computer's memory. Change operation can be performed during RUN operation. Note: To enter the on-direct mode, match the contents in the CPU's memory and personal computer's memory.</p>	<ul style="list-style-type: none"> I/O assignment information can be read. Initialize the CPU when starting up for the first time after the unit is unpacked or when a battery error occurs.
2	Dedicated programming console (GPCL01H, etc.)	<p>[For off-line/on-line operation] Creates an I/O assignment table, inputs the program to be created, and transfers the program to the CPU in online mode.</p> <p>[For direct operation] As each program is entered one by one, it is directly written to the CPU. Change operation can be performed during RUN operation. Note: This mode is not available for Windows® version.</p> <p>[During on-direct operation] On-direct operation cannot be performed.</p>	

Portable graphic programmers and instruction language programmers can not be used.

7.3 Programming Methods

The following shows the system configuration using a personal computer and the procedures for creating a user program using personal computer software. Please note that cables differ depending on the personal computer and software used.

Table 7.3 System configuration using a personal computer

No.	Personal computer software used	DOS/V PC						PC9800 series personal computer																	
1	LADDER EDITOR (Windows® version)																								
		CPU setting												Specify H-302.											
		Memory assignment												Specify RAM-04H (4 K memory).											
		Cable (MICRO-EH side)						EH-RS05						EH-VCB02						EH-RS05					
		Cable (personal computer side)						WVCB02H												WPCB02H					
		Port 1 *1, *2		10-point type		There are no DIP switches (fixed to 4800 bps).										Same as left									
				14/23/28-point type		Status		DIP SW	1	2	3	4													
								ON	OFF	ON	OFF	38.4 kbps													
								ON	OFF	OFF	OFF	19.2 kbps													
								OFF	OFF	ON	OFF	9600 bps													
OFF	OFF	OFF	OFF	4800 bps																					
Port 2		10/14-point type		Port 2 does not exist.																					
		23/28-point type		Cannot be connected with the above configuration since the RS-422/485 are used (RS-232C/422 converters are required.) Set the transmission speed in the special internal output (WRF03D).																					
2	LADDER EDITOR (DOS version)																								
		CPU setting												Specify H-302.											
		Memory assignment												Specify RAM-04H (4 k memory).											
		Cable (MICRO-EH side)						EH-VCB02						EH-RS05											
		Cable (personal computer side)												PCCB02H											
		Port 1 *1, *2		10-point type		There are no DIP switches (fixed to 4800 bps).										Same as left									
				14/23/28-point type		Status		DIPSW	1	2	3	4													
								OFF	OFF	OFF	OFF	4800 bps													
		Port 2		10/14-point type		Port 2 does not exist.																			
				23/28-point type		Cannot be connected with the above configuration since the RS-422/485 are used (RS-232C/422 converters are required.) Set the transmission speed in the special internal output (WRF03D).																			

*1: Settings of the port 1 can be changed when the DR signal is off. When the DR signal is on, the setting is fixed.

*2: Set the port 1 to the transmission control procedure 1 by the special internal output (WRF01A). (The default is the transmission control procedure 1.)

Note: Refer to the manual of the applicable software on how to install and operate each software (LADDER EDITOR).

Table 7.4 List of procedures for creating a program

Item	Create new program	Modify	Test operation, adjustment	
	Off-line	Off-line	On-line	On-direct
Out-line of operating procedure	<pre> graph TD Start([Start]) --> SelectOffLine[Select off-line] SelectOffLine --> InitPLC[Initialize PLC] InitPLC --> CPUType[CPU type: Specify H-302 Memory type: Specify RAM-04H] CPUType --> CreateIO[Create I/O assignment Create program] CreateIO --> ProgramCheck{Program check} ProgramCheck -- NG --> CreateIO ProgramCheck -- OK --> SaveFD[Save in FD, etc.] SaveFD --> End([End]) </pre>	<pre> graph TD Start([Start]) --> SelectOffLine[Select off-line] SelectOffLine --> Regenerate[Regenerate from FD, etc.] Regenerate --> Utilize[When utilizing a program created in another H-series CPU type: Specify H302 Memory type: Specify RAM-04H] Utilize --> ModifyIO[Modify I/O assignment Modify program] ModifyIO --> ProgramCheck{Program check} ProgramCheck -- NG --> ModifyIO ProgramCheck -- OK --> ChangeName[Change the name and save in FD, etc.] ChangeName --> End([End]) </pre>	<pre> graph TD Start([Start]) --> SelectOnLine[Select on-line] SelectOnLine --> Regenerate[Regenerate from FD, etc.] Regenerate --> InitCPU[Initialize the CPU when running it for the first time(right after purchase, etc.)] InitCPU --> TransferPLC[Transfer program (PLC -> CPU) *1] TransferPLC --> CPUErrCheck{CPU error check} CPUErrCheck -- NG --> ConductTest[Conduct test operation] CPUErrCheck -- OK --> ConductTest ConductTest --> OperationCheck{Operation check} OperationCheck -- NG --> ToModification[To modification] OperationCheck -- OK --> End([End]) </pre>	<pre> graph TD Start([Start]) --> SelectOnLine[Select on-line] SelectOnLine --> TransferCPU[Transfer program (CPU -> PLC)] TransferCPU --> SelectOnDirect[Select on-direct] SelectOnDirect --> ConductTest[Conduct test operation] ConductTest --> ModifyProgram[Modify program (modify during RUN, etc.)] ModifyProgram --> OperationCheck{Operation check} OperationCheck -- NG --> ModifyProgram OperationCheck -- OK --> EnterFD[Enter in FD, etc.] EnterFD --> End([End]) </pre>
Situation	When creating a new program	When modifying a program	When transferring a created program to the CPU for the first time	When modifying a program during test operation
Point	A program can be created without executing MICRO-EH.	When using a program that was used in another H-series, specify H-302 as the CPU type.	When performing CPU error check, make sure the I/O assignment matches the loaded module. (The loading read function can be used to match them forcibly.)	To enter the on-direct mode, match the contents in the CPU's memory and personal computer's memory. The modified contents will be reflected in both the computer memory and CPU memory.

*1: Set the flow size to 0 for memory assignment.

If a program transfer is performed by specifying the flow size, the message "Cannot execute: Operation error" is displayed, and a peripheral unit remain as WRITE occupied. In this case, either cancel the occupy state from LADDER EDITOR of the peripheral unit or by re-entering the CPU power.

The user program is managed in circuit units. One circuit can describe nine contact points (a-type contact point or b-type contact point) and seven coils as shown in the figure below.

Figure 7.1 Size of one circuit

Or, one relational box can be described using the width of three contact points. The relational box can be considered as an a-type contact point that turns on when the conditions in the box are established (Figure 7.2).

Figure 7.2 Example when using a relational box

In addition, if loop symbols are used, a circuit containing up to 57 contact points and one coil can be entered within seven lines.

However, an OR circuit cannot be input after a loop.

Figure 7.3 Example when using loop symbols

A processing box can be placed at the coil position. The processing instructions, application instructions, control instructions, transfer instruction and fun instructions can be described in a processing box. A maximum of 19 instructions can be described in one processing box. The processing box is executed when the conditions in the contact section to be connected directly in advance is established. The processing box is not executed if the condition is not established. See the chapter on the “Instruction Specifications” for details on each instruction.

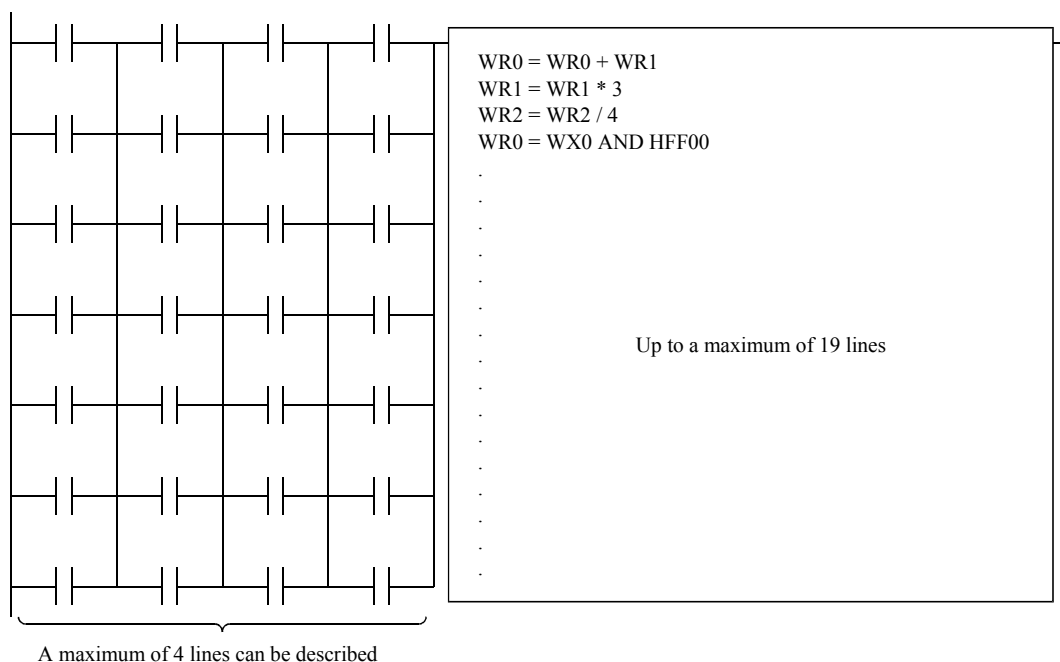

Figure 7.4 Example when using a processing box

Note: For the LADDER EDITOR for Windows®, a processing box can be displayed in one contact point width, so a circuit of nine contact points and one processing box can be entered. For more details, refer to the user's manual for the LADDER EDITOR for Windows®.

7.4 Program Transfer

The MICRO-EH stores the user programs written from the peripheral units in the execution memory (RAM). Then, it transfers the user programs to the FLASH memory (backup memory) utilizing the idle time of the MPU in the internal area of the MICRO-EH. This is performed regardless of operation status of the CPU. Therefore, the programs may not be written into the backup memory (FLASH memory) even though the peripheral units display that program transfer has been completed. If the power is turned off before the programs are written to the FLASH memory, the customer's programs may be lost.

In order to prevent such crisis, it is necessary to monitor the Backup Memory Writing Progress Flag (R7EF) after the programs are transferred. When this bit special internal output is ON, it indicates that the data (programs, etc.) are being transferred to the backup memory. When it is OFF, it indicates that the data is not being written to the backup memory. Turning off the power after making sure that the Backup Memory Writing Progress Flag (R7EF) turns off after the program is transferred from the peripheral unit to the MICRO-EH will ensure that the program is backed up properly. (The transfer to the backup memory takes approximately two minutes.)

If a new program is written from a peripheral unit while a user program is being transferred to the backup memory (FLASH memory), the user program transfer to the backup memory will be stopped and the new program will be transferred to the backup memory. Therefore, the program that is stored in the backup memory will be the program that is written last.

In addition to the user programs, the settings to be stored in the special internal outputs can be transferred to the backup memory. The transfer of the special internal outputs for various settings (Note 1) can be executed by turning ON the Memory Request for Various Settings Flag (R7F6). As with the transfer of the user programs, the Backup Memory Writing Progress Flag (R7EF) will be turned ON during this transfer.

Figure 7.5 below shows the operation of the Backup Memory Writing Progress Flag (R7EF) during the backup of the special internal output for various settings and the backup of the user programs. Note that when one is being transferred, the next transfer will not start until the current transfer is complete.

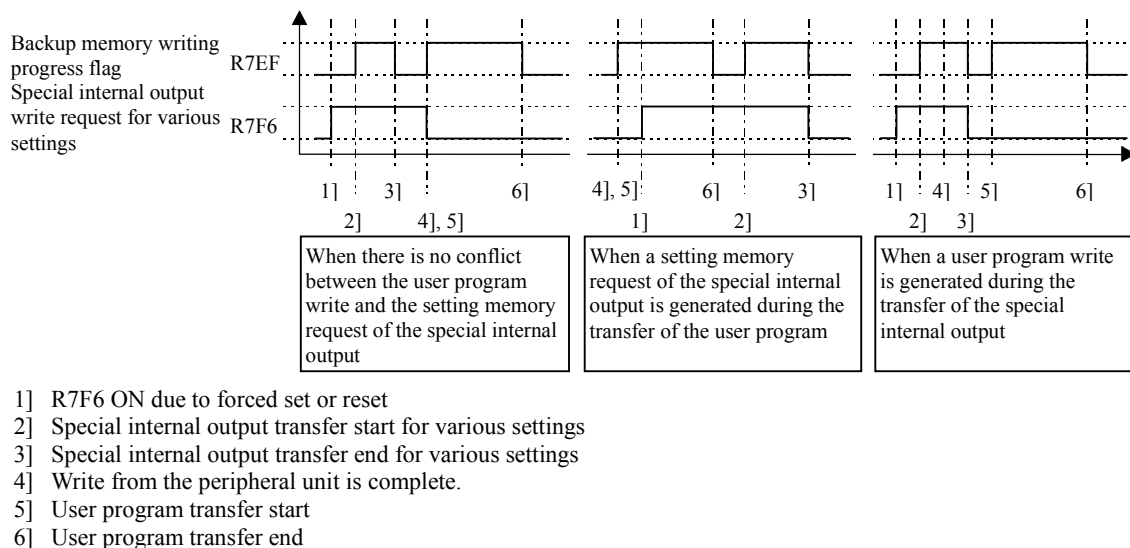

Figure 7.5 Operation of the bit special internal output when backup memory is being accessed

Note:

- The backup memory cannot be written during pulse output. If a program is changed during RUN with respect to the CPU during pulse output, turn off the power supply approximately two minutes after pulse output stops.
- Pulses cannot be output while the backup memory is being written. Commence pulse output once again after the Backup Memory Writing Progress Flag turns off.

Note 1) The following lists the special internal outputs for various settings that can be transferred to the backup memory by the Memory Request for Various Settings Flag (R7F6).

Table 7.5 List of special internal outputs that can be stored

No.	Special internal output that can be stored	Function
1	WRF01A	Dedicated port 1 Communication settings
2	WRF03C	Dedicated port 1 Modem timeout time
3	WRF03D	Dedicated port 2 Communication settings
4	WRF06B	Pulse/PWM automatic correction settings
5	WRF06C	Potentiometer 1 Filtering time
6	WRF06D	Potentiometer 2 Filtering time
7	WRF06E	Analog input type selection
8	WRF06F	Phase counting mode

23	WRF07E	Input edge
24	WRF07F	Input filtering time

Chapter 8 High-speed counter, PWM / Pulse train output and Analogue I/O

The MICRO-EH operates in four operation modes. By selecting the proper operation mode, input/output points can be assigned to the counter input, interrupt input, pulse output, and PWM output functions, instead of the normal input/output function.

The 14-point type model or higher are equipped with two potentiometers. The values of internal outputs can be changed externally using these potentiometers, without peripheral units.

The 23-point type model is equipped with two points of analogue input and one point of analogue output.

This chapter explains how to set various functions mentioned above, together with simple usage examples.

8.1 Input/Output Function

The normal input/output points can not only be used as they are, but can also be assigned special functions. In order to assign these special functions, it is necessary to select the right operation mode; the following briefly explains the procedure for selecting the operation modes. Refer to the section corresponding to each item for the details.

8.1.1 Initial Setting for Special Input/Output Function

Figure 8.1 shows a flowchart for the setting procedures.

First, select an operation mode. There are 5 operation modes, mode 0 to 3 and 10. By selecting an operation mode the input number to be used for high-speed counter input and the type of counter is determined, along with the output number for the corresponding output.

Next, the desired input/output function for each point of input/output should be selected, because the function assigned to input/output varies depending on the operation mode selected.

Lastly, set the operating conditions for each input/output function selected.

Furthermore, performing the settings mentioned above does not in itself make the settings valid for the actual operation.

The settings become valid only after turning on the special internal output for individual setting (R7F5). After making the settings valid, it is possible to make changes for each function using the special internal output for individual setting.

Turning the special internal output (R7F6) on also stores the settings performed above in the FLASH memory. From the next time the power supply is turned on, the settings stored in the FLASH memory are automatically read; it is not necessary to perform the settings every time.

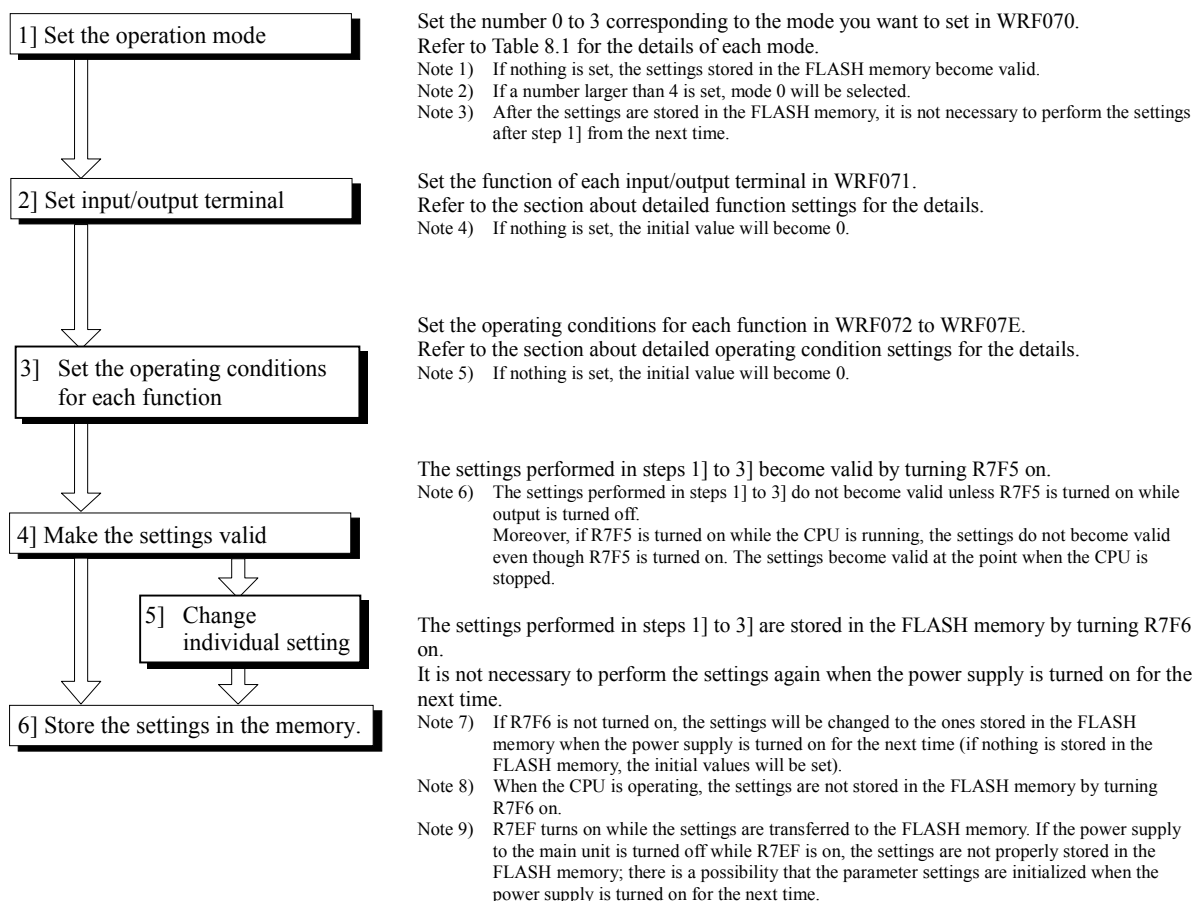

Figure 8.1 Flow of operation mode setting procedure

8.1.2 Operation Mode

Select one mode from the 5 modes shown in Table 8.1 (mode 10 described in following pages.) and set the mode number in the special internal output WRF070 when the CPU is in STOP status.

- *1: If parameter in WRF070 is not saved by R7F6, the value will be 0 at the next power on.
- *2: The operation mode setting can be changed only when CPU is in STOP status.

Each input and output terminal setting is configured in WRF071.

Table 8.1 Operation mode list

	Mode 0	Mode 1	Mode 2		Mode 3	
	Standard	Single-phase counter ×2	Single-phase counter ×4		2-phase counter ×1, Single-phase counter ×1	
X0	Standard input	Counter input 1	Counter input 1		Counter input 1A	
X1	Standard input	Counter preload 1	Counter preload 1		Counter preload 1	
	Interrupt input 1	Counter strobe 1	Counter strobe 1		Counter strobe 1	
X2	Standard input	Standard input *6	Standard input *6		Standard input *6	
		Counter input 2	Counter input 2		Counter input 1B	
X3	Standard input	Counter preload 2	Counter preload 2		Counter input (marker) 1Z	
	Interrupt input 2	Counter strobe 2	Counter strobe 2			
X4	Standard input	Standard input *6	Standard input *6			
		Standard input	Counter input 3		Standard input	
X5	Standard input	Standard input	Counter preload 3		Standard input	
	Interrupt input 3	Interrupt input 3	Counter strobe 3		Interrupt input 3	
X6	Standard input *3	Standard input *6	Standard input *6			
		Standard input *3	Counter input 4 *3		Counter input 4 *3	
X7	Standard input *3	Standard input *3	Counter preload 4 *3		Counter preload 4 *3	
	Interrupt input 4 *3	Interrupt input 4 *3	Counter strobe 4 *3		Counter strobe 4 *3	
Y100	Standard output	Standard input *6	Standard input *6		Standard input *6	
		Counter output 1	Counter output 1		Counter output 1	
Y101	PWM output 1	Standard output *6	Standard output *6		Standard output *6	
	Pulse output 1					
Y102	Standard output	Counter output 2	Counter output 2		Standard output	
	PWM output 2 *5	Standard output *6	Standard output *6		PWM output 2 *5	
Y103	Pulse output 2 *5				Pulse output 2 *5	
	Standard output	Standard output	Counter output 3		Standard output	
Y104	PWM output 3 *5	PWM output 3 *5	Standard output *6		PWM output 3 *5	
	Pulse output 3 *5	Pulse output 3 *5			Pulse output 3 *5	
Y105	Standard output	Standard output	Counter output 4 *4	Standard output	Counter output 4 *4	Standard output
	PWM output 4 *5	PWM output 4 *5	Std. output *6	PWM out 4 *5	Std. output *6	PWM out 4 *5
Y106	Pulse output 4 *5	Pulse output 4 *5		Pulse out 4 *5		Pulse out 4 *5

*3: Modes 0 to 3 can be set regardless of the type of CPU however, note that the 10-point type does not have X6 and X7.

*4: It is only possible to select either Standard output, PWM output, or pulse output for the 10- point type CPU. (A counter corresponding output cannot be set because there is no counter input that can correspond to it.)

*5: It is possible to set for the relay output type, but the expected output waveform cannot be obtained. Moreover, care must be taken because it may cause a relay error.

*6: This assignment is supported by Ver.1.11 (WRF051=H0111) or newer.

8.1.3 Input/Output Setting

Configure each I/O setting in the special internal output (WRF071) and make it effective by setting R7F5 ON in CPU STOP status. This information is normally reset at every power on, but this can be saved in the FLASH memory by setting R7F5 ON after that.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

*2 : Configuration of 10 point type.

8.1.4 Input/Output Setting (Mode 10)

Mode 10 had been added since Ver. 01.13. I/O assignment of mode 10 is very flexible as follows.

Parameter setting is compatible with existing mode 0 to 3 except for WRF071. Operation of FUN command (FUN 140 - 150) is same for all the mode 0 to 10.

■ Outline

Input and output are configured in every group as below.

Fig. 8.4 Group of mode 10

■ Mode setting

Set "H10" to the special internal output WRF070.

■ In/output setting

Set parameter according to the following table to the special internal output WRF071.

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF071 :	Group 1				Group 2				Group 3				Group 4			
Default :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fig. 8.5 Bit table of WRF071

Select one of below combinations and set in WRF071 for every group.

Fig. 8.2 Parameter for in/output setting

Parameter	X0 / 2 / 4 / 6	X1 / 3 / 5 / 7	Y100/101/102/103
H 0	Standard input	Standard input	Standard output
H 1			PWM output
H 2			Pulse output
H 3		Interrupt input	Standard output
H 4			PWM output
H 5			Pulse output
H 6	Counter input	Standard input	Standard output
H 7			Counter output
H 8		Preload input	Standard output
H 9			Counter output
H A		Strobe input	Standard output
H B			Counter output
Others	Standard input	Standard input	Standard output

Since 10 points type does not have input X6 and X7, possible value for group 4 is 0 to 2.

■ Example

Group	Function			Value
1	X0 : Standard input	X1 : Standard input	Y100 : Pulse output 1	→ H2
2	X2 : Counter 2	X3 : Preload input 2	Y101 : Standard output	→ H8
3	X4 : Counter 3	X5 : Standard input	Y102 : Counter output 3	→ H7
4	X6 : Standard input	X7 : Interrupt input 4	Y103 : Standard output	→ H3

→ WRF071 = H2873

8.1.5 Special Output Operation in CPU STOP Status

Generally the counter output, PWM output and pulse output are not generated if the CPU is in the STOP state. To output these outputs when the CPU is in the STOP state, turn on the special internal output R7DC. By turning on the special internal output R7DC for controlling the special outputs in the STOP state, the operation of the special outputs at the time of test operation can be checked, and the outputs that are independent of the RUN and STOP states of the CPU can be output. Note that the R7DC is set to 0 when the power is turned on. Also, if the output control flag (R7FC to R7FF) is turned on while the CPU is in the STOP state and the R7DC is off, the output flag is turned off by the system.

Figure 8.4 Operation of special outputs when the CPU is in the RUN/STOP states

- 1] When the R7DC is off, the output control flag is turned off by the system.
- 2] When the R7DC is on, the corresponding special output turns on by turning on the output control flag.
 - * The counter output of the counter turns on when the condition is satisfied.
- 3] The special outputs turn on and off according to the user program.
- 4] The special outputs are being output while the output condition is satisfied or the R7DC is on.
- 5] The special outputs turn on and off according to the RUN/STOP states of the CPU. The output control flag is turned off by the system when the CPU operation stops.
 - * The special outputs continue to be output as long as the CPU operation continues, even if an error has occurred when the operation is set to be continued when I/O assignments do not match or when a congestion error occurs.

8.1.6 Pulse / PWM Output adjustment

The transistor output that generates the pulse output and PWM output contains a hardware delay time. This delay time affects the on-duty significantly as the frequency increases. In addition, this delay time is slightly different depending on the CPU model. By setting the value that corresponds to the CPU model in the special internal output WRF06B for setting the PWM/pulse output correction, both the PWM output and pulse output with no load in the system can be corrected.

Caution: There will be a slight error even if correction setting is performed.

These special internal outputs are stored in the FLASH memory by turning on the various setting write request (R7F6). Once the setting is stored in the FLASH memory, it is not necessary to make the setting again when the power is turned on next time.

WRF06B: Setting value indicating the CPU model

Figure 8.3 Special internal outputs for setting PWM/pulse output correction

CPU model	Setting value	Remark

EH-***DT	H0002	
EH-***DRP	H0003	
EH-***DRT	H0004	
Other than above	Other than above	No correction

Note: *** changes depending on the CPU.

8.2 High-Speed Counter (Single-Phase)

The high-speed counter settings are stored in the special internal outputs (WRF070 to 7E). It is only possible to perform the setting through the special internal output (WRF071) when the CPU is stopped and the output is turned off. Once all the input/output settings are completed, the settings of each counter can be changed using the special internal outputs for individual setting (WRF058 to 5B), regardless of whether the CPU is operating or stopped. In addition, the settings can be changed by a program using the FUN instruction (FUN140 to 142, and 146). Refer to the chapter about the FUN instruction for information about how to use the FUN instruction for setting.

8.2.1 Operation of Single-Phase Counter

(1) Basic operation

Figure 8.5 describes the basic operation of the high-speed counter.

Figure 8.5 Basic operation of high-speed counter (single-phase)

Up counter

- 1] The counter output turns on* when the current counter value becomes larger than the on-preset value. The interrupt process (INT2n) starts up if an interrupt program is used in the running user program.
- 2] The counter output turns off when the current counter value becomes larger than the off-preset value. The interrupt process (INT2m) starts up if an interrupt program is used in the running user program.
- 3] The counter values wrap around in a ring. That is, the current counter value goes back to 0h when one more pulse is counted after the maximum value (FFFFH) is reached.

Down counter

- 4] The counter output turns on* when the current counter value becomes smaller than the off-preset value. The interrupt process (INT2m) starts up if an interrupt program is used in the running user program.
- 5] The counter output turns off when the current counter value becomes smaller than the on-preset value. The interrupt process (INT2n) starts up if an interrupt program is used in the running user program.
- 6] The counter values wrap around in a ring. That is, the current counter value becomes FFFFH when one more pulse is counted after the minimum value (0H) is reached. Note also that the initial value of the counter is 0H, and the value reaches FFFFH after the first pulse is counted after the start of operation.

Others

- 7] The user program can switch from using a counter as an up counter to a down counter, as well as from a down counter to an up counter while the counter is operating (using FUN142).

* The counter output does not turn on unless the control output flag (R7FC to R7FF) is turned on.

(2) Preload input operation

When a preload signal is entered, the current counter value is reset to the preload value.

The counter output is controlled only when the on-preset value or off-preset value is exceeded by the progress of the counter value. Because of this, the counter output maintains its status before the preload input when the on-preset or off-preset value is exceeded due to the preload value (when jumping from the Off area to the On area, or vice versa). Also, the status of the counter output is reflected in the data memory at the timing of the refresh process. Therefore, it should be noted that the status monitored by peripheral units, etc. and the actual output status may be different (by a delay of one scan).

Figure 8.6 Preload input operation of high-speed counter (single-phase)

(3) Strobe input operation

When a strobe signal is entered, the current counter progress value is stored in the strobe storage area (WRF07A to 7D) of the special internal output.

(4) Current value clear instruction operation

When the current value clear instruction (FUN144) is executed, the current counter value is reset (cleared) to zero. The counter output is controlled only when the on-preset value or off-preset value is exceeded by the progress of the counter value. Because of this, the counter output maintains its status before the execution of the current value clear instruction when either the on-preset or off-preset value is exceeded due to the execution of the current value clear instruction (when jumping from the Off area to the On area, or vice versa).

Figure 8.7 Current value clear instruction operation of high-speed counter (single-phase)

8.2.2 Setting of Single-Phase Counter

If either one of operation modes 1, 2, or 3 is selected, the single-phase counter should be set using the special internal output (WRF072 to WRF07E). In order to make the contents of the various settings valid, it is necessary to turn on the special internal output R7F5. The settings can be changed using the FUN instruction during the CPU operation (some settings cannot be changed, however.)

(1) Setting the counter input

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF07E:	a	b	c	d	e	f	g	h	Not used							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Figure 8.8 Special internal output for setting counter input

	Bit	Setting value	Count edge	Bit	Setting value	Count operation
Counter 1	a	0	Rising edge	e	0	Up count operation ^{*1}
		1	Falling edge		1	Down count operation ^{*1}
Counter 2	b	0	Rising edge	f	0	Up count operation ^{*1}
		1	Falling edge		1	Down count operation ^{*1}
Counter 3	c	0	Rising edge	g	0	Up count operation ^{*1}
		1	Falling edge		1	Down count operation ^{*1}
Counter 4	d	0	Rising edge	h	0	Up count operation ^{*1}
		1	Falling edge		1	Down count operation ^{*1}

^{*1} Can also be made valid by executing FUN142.

In case of mode 1, the settings for counter 3 and 4 are ignored.

In case of mode 3, the settings for counter 1 to 3 are ignored.

(2) Setting the on-preset value

Set the count value at which the counter output is turned on (the on-preset value) for every counter used. Any value in the range from 0 to FFFFH (0 to 65, 535) can be set. If the on-preset value is set to the same value as the off-preset value, the counter will not perform any counting operation (see (5)).

WRF072:	On-preset value for counter 1
WRF073:	On-preset value for counter 2
WRF074:	On-preset value for counter 3
WRF075:	On-preset value for counter 4

Figure 8.9 Special internal outputs for setting the on-preset values

In case of mode 1, WRF074 and WRF075 are used to set the frequency for the PWM/pulse outputs.

In case of mode 3, WRF073 and WRF074 are used to set the frequency for the PWM/pulse outputs.

(3) Setting the off-preset value

Set the count value at which the counter output is turned off (the off-preset value) for every counter used. Any value in the range from 0 to FFFFH (0 to 65, 535) can be set. If the off-preset value is set to the same value as the on-preset value, or larger than the on-preset value, the counter will not perform any counting (see (5)).

WRF076:	Off-preset value for counter 1
WRF077:	Off-preset value for counter 2
WRF078:	Off-preset value for counter 3
WRF079:	Off-preset value for counter 4

Figure 8.10 Special internal outputs for setting off-preset values

In case of mode 1, WRF078 and WRF079 are used to set the on-duty for the PWM/pulse outputs.

In case of mode 4, WRF077 and WRF078 are used to set the on-duty for the PWM/pulse outputs.

(4) Setting the counter preload

When preloading is used, the value to be preloaded should be set for each counter used. Any value in the range from 0 to FFFFH (0 to 65,535) can be set.

WRF07A:	Preload value for counter 1
WRF07B:	Preload value for counter 2
WRF07C:	Preload value for counter 3
WRF07D:	Preload value for counter 4

Figure 8.11 Special internal outputs for setting the preload values

This special internal output becomes valid immediately after the setting.

In case of mode 1, WRF07C and WRF07D are used to set the number of pulse outputs.

In case of mode 4, WRF07B and WRF07B are used to set the number of pulse outputs.

(5) At abnormal setting

If the on-preset and off-preset settings contain the same values for one or more counters when the PI/O function setting flag (R7F5) is turned on, the corresponding bit in the error display special internal output turns on and the counters with error settings do not perform any counting. (It does not count even if a counter input is entered.) In addition, the setting abnormal flag (R7F7) turns on.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

b	Pulse 4 frequency abnormality	Y103
c	Pulse 3 frequency abnormality	Y102
d	Pulse 2 frequency abnormality	Y101
e	Pulse 1 frequency abnormality	Y100
f	Counter 4 preset value abnormality	X6
g	Counter 3 preset value abnormality	X4
h	Counter 2 preset value abnormality	X2
i	Counter 1 preset value abnormality	X0

(6) Individual counter setting

The on-preset and off-preset values can be changed for each counter by the special internal outputs for individual setting regardless of whether the CPU is operating or stopped. Turn on the corresponding bit in the following special internal outputs when only the on-preset or the off-preset value should be changed for a certain counter input. (To change both settings at the same time, set the "H3" in the corresponding special internal outputs for individual setting.)

Moreover, when the specified on-preset and off-preset values are the same, the corresponding bit of the error display special internal output is turned on and operation is performed using the preset value before the setting. (The set value for the special internal output also returns to the preset value before the setting was made)

		15		2		1	0

In case of mode 1, WRF05A and WRF05B are used to set individual PWM/pulse outputs.

In case of mode 4, WRF059 and WRF05A are used to set individual PWM/pulse outputs.

8.3 High-Speed Counter (Two-Phase Counter)

When operation mode 3 is selected, two-phase counters can be used. Four kinds of phase counting modes are available for two-phase counters.

The settings of the two-phase counters are stored in the special internal outputs (WRF06F to 72, 76, 7A, and 7E). It is only possible to perform the settings through the special internal output (WRF071) when the CPU is stopped and the output is turned off. Once all the input/output settings are completed, the setting of each counter can be changed using the special internal outputs for individual setting (WRF058), regardless of whether the CPU is operating or stopped. In addition, the setting can be changed by a program using the FUN instruction (FUN140 to 142, and 146). Refer to the chapter about the FUN instruction for information about how to use the FUN instruction for setting.

8.3.1 Operation of Two-Phase Counters

The phase counting mode settings are stored in the special internal output (WRF06F). The operation of the counter values is the same as for a single-phase counter and likewise wrap around from 0000H to FFFFH. In case of an up counter, the count value becomes 0000H if one more pulse is input while the current count value is FFFFH. In case of a down counter, the count value becomes FFFFH if one more pulse is input while the current count value is 0000H. Moreover, the preload input operation, strobe input operation, and executing operation of the current value clear instruction are run in the same manner as for a single-phase counter. The status of the counter output is stored in the data memory at the timing of the refresh process. Therefore, it should be noted that the status monitored by peripheral units, etc. and the actual output status may be different (by a delay of one scan).

(1) Phase counting mode 0

The counter counts up when input 1A is ahead of input 1B, and down when input 1A is lagging behind input 1B.

Figure 8.14 Counting operation of phase counting mode 0

Input 1A	Input 1B	Operation
1 (High)	↑ (Rising edge)	Up count
0 (Low)	↓ (Falling edge)	
↓ (Falling edge)	1 (High)	
↑ (Rising edge)	0 (Low)	
0 (Low)	↑ (Rising edge)	Down count
1 (High)	↓ (Falling edge)	
↓ (Falling edge)	0 (Low)	
↑ (Rising edge)	1 (High)	

(2) Phase counting mode 1

In this mode the counter counts at the rising edge of input 1A. At this point, if input 1B is 0 (Low) it counts up, and if input 1B is 1 (High) it counts down.

Figure 8.15 Counting operation of phase counting mode 1

Input 1A	Input 1B	Operation
1 (High)	↑ (Rising edge)	Do not count
0 (Low)	↓ (Falling edge)	
↓ (Falling edge)	1 (High)	
↑ (Rising edge)	0 (Low)	Up count
0 (Low)	↑ (Rising edge)	Do not count
1 (High)	↓ (Falling edge)	
↓ (Falling edge)	0 (Low)	
↑ (Rising edge)	1 (High)	Down count

(3) Phase counting mode 2

In this mode, if input 1B is 0 (Low) at the rising edge of input 1A the counter counts up, and if input 1A is 0 (Low) at the rising edge of input 1B, the counter counts down.

Figure 8.16 Counting operation of phase counting mode 2

Input 1A	Input 1B	Operation
1 (High)	↑ (Rising edge)	Do not count
0 (Low)	↓ (Falling edge)	
↓ (Falling edge)	1 (High)	
↑ (Rising edge)	0 (Low)	Up count
0 (Low)	↑ (Rising edge)	Down count
1 (High)	↓ (Falling edge)	Do not count
↓ (Falling edge)	0 (Low)	
↑ (Rising edge)	1 (High)	

(4) Phase counting mode 3

In this mode the counter counts at the rising and falling edge of input 1B. It counts up when input 1A is more ahead of input 1B, and down when input 1A is lagging behind input 1B.

Figure 8.17 Counting operation of phase counting mode 3

Input 1A	Input 1B	Operation
1 (High)	↑ (Rising edge)	Up count
0 (Low)	↓ (Falling edge)	
↓ (Falling edge)	1 (High)	Do not count
↑ (Rising edge)	0 (Low)	
0 (Low)	↑ (Rising edge)	Down count
1 (High)	↓ (Falling edge)	
↓ (Falling edge)	0 (Low)	Do not count
↑ (Rising edge)	1 (High)	

(5) Clear input operation (common to all the phase counting modes)

The count value is cleared at the rising edge of input 1Z. As an example, the clear operation of phase counting mode 4 is shown in Figure 8.18. (The clear operation works identically for all four phase counting modes.)

Figure 8.18 Count value clear operation (phase counting mode 4)

8.3.2 Setting of Two-Phase Counter

The setting of the two-phase counters are stored in the special internal outputs (WRF072 to WRF07E).

(1) Phase counting mode

Set the phase counting mode (0-3) in WRF06E. Please see the chapter 8.3.1 about phase counting mode.

WRF06F: Phase counting mode

Figure 8.19 Special internal output for phase counting mode

(2) Setting the on-preset value

Set the count value (the on-preset value) at which the counter output is turned on (or off). Any value in the range from 0 to FFFFH (0 to 65, 535) can be set. If the on-preset value is set to the same value as the off-preset value, or smaller than the off-preset value, the counter will not perform any counting (see (4)).

WRF072: On-preset value for two-phase counter

Figure 8.20 Special internal output for setting the on-preset value

(3) Setting the off-preset value

Set the count value (the off-preset value) at which the counter output is turned off (or on). Any value in the range from 0 to FFFFH (0 to 65, 535) can be set. If the off-preset value is set to the same value as the on-preset value, or larger than the on-preset value, the counter will not perform any counting (see (4)).

WRF076: Off-preset value for two-phase counter

Figure 8.21 Special internal output for setting the off-preset value

(4) Setting the counter preload

When preloading is used, the value to be preloaded should be set for each counter used. Any value in the range from 0 to FFFFH (0 to 65, 535) can be set.

WRF07A: Preload value for two-phase counter

Figure 8.22 Special internal output for setting the preload value

This special internal output becomes valid immediately after the setting.

(5) Diagnostic error

If the on-preset and off-preset settings contain the same values for one or more counters when the PI/O function setting flag (R7F5) is turned on, the corresponding bit in the abnormality display special internal output turns on and the counters with abnormal settings do not perform any counting. (It does not count even if a counter input is entered.) In addition, the setting abnormal flag (R7F7) turns on.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF057:	a	Not used						b	c	d	e	f	g	h	i

f	Counter 4 preset value abnormality	X6
g	Counter 3 preset value abnormality	-
h	Counter 2 preset value abnormality	-
i	Two-phase counter 1 preset value abnormality	X0 to X3

(5) Individual counter setting

The on-preset and off-preset values can be changed for each two-phase counter by the special internal output for individual setting (WRF058) regardless of whether the CPU is operating or stopped. Turn on the corresponding bit in the following special internal outputs when only the on-preset or the off-preset value should be changed for a two-phase counter. (To change both settings at the same time, set the “H3” in the corresponding special internal outputs for individual setting.)

Moreover, when the specified on-preset and off-preset values are the same, the corresponding bit of the error display special internal output is turned on and operation is performed using the preset value before the setting. (The set value for the special internal output also returns to the preset value before the setting was made)

a	Off-preset change request
b	On-preset change request

8.4 PWM Output

A PWM output can be set as an output by setting the operation mode and output terminal. By setting an output to a PWM output, a pulse with a duty ratio in the range that corresponds to the specified frequency can be output.

8.4.1 Operation of PWM Output

The PWM output settings are stored in the special internal outputs. It is only possible to perform the settings through the special internal output when the CPU is stopped and the output is turned off. Once all the input/output settings are completed, the setting of each PWM output can be changed using the special internal outputs for individual setting, regardless of whether the CPU is operating or stopped. In addition, the settings can be changed by a program using the FUN instruction (FUN148). See the chapter about the FUN instruction for information about how to use the FUN instruction for setting.

(1) Basic operation

The special internal outputs R7FC to R7FF are used to control the output. When these special internal outputs are turned on, a pulse is output at the frequency and the on-duty set in the special internal outputs (WRF072 to 79). When the special internal output for output control is turned off, the PWM output is also turned off. The special internal outputs R7FC to R7FF correspond to PWM outputs 1 to 4 (Y100 to Y103); for example, if R7FD is turned on, a pulse train is output from PWM output 2 (Y101). The on/off status of the PWM outputs is not stored in the data memory. Therefore, the status of the terminals used for PWM output monitored by peripheral units, etc. may be different from the actual status of the PWM output terminals.

When a fatal or serious error occurs in the CPU, there will be no output. The output is also stopped if a fatal or serious error occurs in the CPU during output.

Figure 8.25 Basic operation of PWM output

(2) Operation when setting values are changed

The settings of each PWM output (frequency and on-duty) can be changed by the FUN instruction or the special internal outputs (WRF072 to 79) regardless of whether the CPU is operating or stopped.

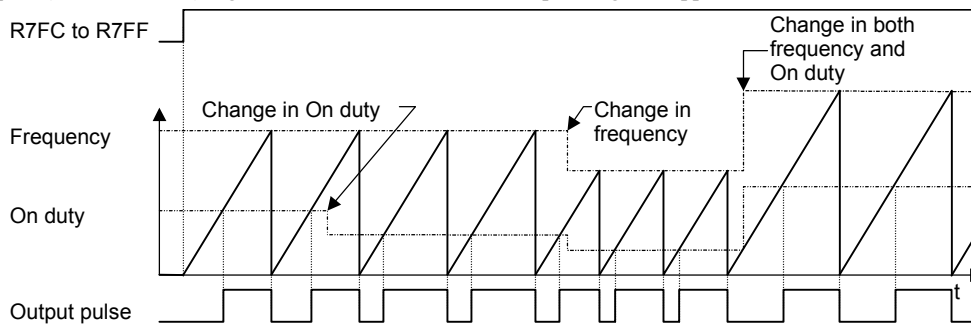

Figure 8.26 Operation of PWM output when setting values are changed.

(3) Operation at abnormal settings

The PWM output is not output if the on-duty is set to a value other than the range in use. However, the FUN instruction does not execute setting change when the setting value is abnormal.

Figure 8.27 Operation of PWM output at abnormal settings

8.4.2 Setting the PWM Output

The settings of the PWM output operation are stored in the special internal outputs (WRF072 to WRF079).

(1) Setting the PWM output frequency

Set the frequency of output pulse for each PWM output to be used in special internal outputs. The setting values must be 10 to 2000 (H0 to H7D0). If the frequency value is set to less than 10 Hz, it is changed to 10 Hz by the system.

It should be noted that the maximum frequency of the PWM output is 2 kHz. Even if a value larger than the maximum frequency is set, an error flag, etc. will not be output, so be careful not to set a frequency that exceeds 2 kHz.

(Example) If the output frequency is 1 kHz, set “1000” (H3E8) in the special internal outputs.

WRF072:	Output frequency for PWM output 1
WRF073:	Output frequency for PWM output 2
WRF074:	Output frequency for PWM output 3
WRF075:	Output frequency for PWM output 4

Figure 8.28 Special internal outputs for setting the PWM output frequency

In case of mode 1, WRF072 and WRF073 are used to set the on-preset value of a counter.

In case of mode 4, WRF072 and WRF075 are used to set the on-preset value of a counter.

(2) Setting the PWM output on-duty value

Set the on-duty value in the corresponding special internal output for each PWM output to be used. The setting values are 0 to 100 (H0 to H64) when the auto correction of on-duty values is not performed. If an on-duty value exceeding this range is specified, PWM outputs will not be generated. When performing auto correction, the range of on-duty values that can be set differs depending on the frequency and CPU mode to be set. For more details on the auto correction, see Section 8.1.5. When a function other than PWM is assigned, this setting is not necessary.

(Example) If the on-duty value is 70 %, set “70” (H46) in the special internal outputs.

WRF076:	On-duty value for PWM output 1
WRF077:	On-duty value for PWM output 2
WRF078:	On-duty value for PWM output 3
WRF079:	On-duty value for PWM output 4

Figure 8.29 Special internal outputs for setting PWM output on-duty

In case of mode 1, WRF076 and WRF077 are used to set the off-preset value of a counter.

In case of mode 4, WRF076 and WRF079 are used to set the off-preset value of a counter.

(3) Effective range of PWM output on-duty values

When correcting on-duty values by setting the value that corresponds to the CPU model in the special internal output (WRF06B) for setting PWM/pulse output correction, the effective range of the on-duty values differs depending on the frequency and CPU model to be used. The effective range of the on-duty values is calculated from the following expressions. For the hardware delay time in the expressions, see Table 6.2.

Caution: There will be a slight error even if correction setting is performed.

$$\text{On-duty lower limit value (\%)} = \text{Hardware delay time (\mu s)} \times \text{Frequency used (Hz)} \times 10^{-4}$$

$$\text{On-duty upper limit value (\%)} = 100 - \text{Hardware delay time (\mu s)} \times \text{Frequency used (Hz)} \times 10^{-4}$$

Table 8.2 Transistor output delay time for each CPU model

CPU model	Hardware delay time (TYP)	Remark
EH-***DTP	50 μ s	
EH-***DT	70 μ s	
EH-***DRP	75 μ s	
EH-***DRT	25 μ s	

Example: If the CPU model is EH-***DRP and the PWM output is 2 kHz,

$$\text{On-duty lower limit value} = 50 \times 2000 \times 10^{-4} = 10 \%$$

$$\text{On-duty upper limit value} = 100 - (50 \times 2000 \times 10^{-4}) = 90 \%$$

Thus, the effective range of on-duty values will be 10 % to 90 %.

If correction is not performed (0 is set in WRF06B), on-duty values can be set in the range of 0 to 100 %. However, caution must be exercised since there will be an error for the period of transistor output delay time between the specified on-duty and the on-duty that is actually output.

(4) Setting abnormality

When the PI/O function setting flag (R7F5) is turned on, and a value exceeding the effective range of on-duty values is set for the on-duty setting value of each PWM output (WRF076 to WRF079), PWM outputs will not be generated.

(Example of incorrect setting) PWM output 2 kHz

On-duty setting value (WRF076) - 95

(5) Individual PWM output setting

The frequency and on-duty can be set for each PWM output by the special internal outputs regardless of whether the CPU is operating or stopped. By setting "H1" in the special internal outputs listed below, it is changed to the frequencies set in the special internal outputs (WRF072 to WRF075) and the on-duty values set in the special internal outputs (WRF076 to WRF079). When changing the setting, if any of the on-duty setting values (WRF076 to WRF079) for PWM outputs is set to a value exceeding the effective range, PWM outputs will not be generated.

a	PWM output: individual setting value change request

8.5 Pulse Train Output

A pulse output can be assigned to an output by setting an output terminal. By setting an output to pulse output, a specified number of consecutive pulses with a duty ratio of 30 to 70 % can be output. ((To output a pulse having a duty ratio of 50 %, set the value corresponding to the CPU model in the special internal output WRF06B, by referring to Section 8.1.4.) A minimum of 10 Hz to a maximum of 5 kHz can be specified as frequency values. (The maximum frequency of 5 kHz represents the total of all pulse output frequencies.)

8.5.1 Operation of Pulse Output

The settings of the pulse outputs are stored in the special internal outputs. It is only possible to perform the settings through the special internal output when the CPU is stopped and the output is turned off. Once all the input/output settings are completed, the setting of each chain output can be changed using the special internal outputs for individual setting, regardless of whether the CPU is operating or stopped. In addition, by using the FUN instruction, settings can be changed by a program (FUN150), or pulse outputs with the acceleration/deceleration function can be generated (FUN151). Refer to the chapter about the FUN instruction for information about how to use the FUN instruction for setting.

(1) Basic operation

The special internal outputs R7FC to R7FF are used to control the output. When these special internal outputs are turned on, a pulse train is output at the frequency set in the special internal outputs (WRF072 to 7D) for the set number of pulses. After the set number of pulses is output, the special internal outputs R7FC to R7FF for output control are turned off by the system. The special internal outputs R7FC to R7FF correspond to pulse outputs 1 to 4 (Y100 to Y103); for example, if R7FD is turned on, a pulse is output from pulse output 2 (Y101). If peripheral units, etc. forcefully turn these special internal outputs off, the pulse output is turned off even if the set number of pulses has not yet been output. The on/off status of the PWM output is not stored in the data memory. Therefore, the status of the terminals used for pulse output monitored by peripheral units, etc. may be different from the actual status of the pulse output terminals.

When a fatal or serious error occurs in the CPU, there will be no output. The output is also stopped if a fatal or serious error occurs to the CPU during output.

In addition, pulses are not output while the backup memory is being written (R7EF=1). Therefore, care should be taken when handling the pulse output immediately after a program transfer or after a program change while running.

Figure 8.31 Basic operation of pulse output

(2) Operation when setting values are changed

The settings of the pulse outputs (frequency and number of output pulses) can be changed by the FUN instruction or the special internal outputs (WRF072 to 7D) regardless of whether the CPU is operating or stopped. If the settings are made during the execution of a program in such way that the total frequency of all the pulse outputs exceeds 5 kHz, the frequency settings will not be changed. Also, the corresponding bit in the abnormality display special internal output is turned on, and the output will continue to operate at the previously set frequency. (The setting value of the special internal output also returns to the value set before the abnormal setting was made.)

In case the frequency becomes 5 kHz or more, the previous setting value is used for operation.

Figure 8.32 Operation when the pulse output frequency is changed

To change the number of output pulses, the following operation will be performed:

- 1] When the number of pulses is to be changed to a value larger than the number of pulses currently being output, pulses will be output until the number of newly changed pulses is reached, and then the pulse output stops.
- 2] When the number of pulses is to be changed to a value smaller than the number of pulses currently being output, the pulse output stops when the current number of pulses is reached.

Figure 8.33 Operation for changing the number of pulse output

8.5.2 Setting of Pulse Output

The settings of the pulse outputs are stored in the special internal outputs (WRF072 to WRF07D).

(1) Setting the pulse output frequency

Set the frequency of the output pulse for each pulse output to be used in all of the special internal outputs shown below. The setting values are 10 to 5000 (HA to H1388). If a value less than 10 Hz is set, it is internally changed to 10 Hz by the system. When setting the frequencies, make sure that the total value of all pulse output frequencies stays within 5 kHz.

(Example 1) Assuming there is one point of pulse output and the output frequency is 5 kHz:

Setting value = 5000 (H1388)

(Example 2) Assuming there are three points of pulse output and the output frequencies are 1 kHz, 1 kHz, and 3 kHz, respectively (the settings should be made so that the sum of the output frequencies set for each of the pulse outputs becomes 5 kHz or less.):

Setting value = 1000 (H3E8)

Setting value = 1000 (H3E8)

Setting value = 3000 (HBB8)

WRF072:	Output frequency for pulse output 1
WRF073:	Output frequency for pulse output 2
WRF074:	Output frequency for pulse output 3
WRF075:	Output frequency for pulse output 4

Figure 8.34 Special internal outputs for setting output frequencies

In case of mode 1, WRF072 and WRF073 are used for setting the on-preset value of a counter.

In case of mode 4, WRF072 and WRF075 are used for setting the on-preset value of a counter.

(3) Setting the number of output pulses

Set the number of output pulses for each pulse output used. The setting values are 0 to 65535 (H0 to HFFFF). If the number of output pulses is set to "0," no pulses will be output.

WRF07A:	Number of output pulses for pulse output 1
WRF07B:	Number of output pulses for pulse output 2
WRF07C:	Number of output pulses for pulse output 3
WRF07D:	Number of output pulses for pulse output 4

Figure 8.35 Special internal outputs for setting number of output pulses

In case of mode 1, WRF07A and WRF07B are used for setting the preload strobe value.

In case of mode 4, WRF07A and WRF07D are used for setting the preload strobe value.

(4) At setting abnormality

If the sum of the frequencies of the pulse outputs is set to exceed 5 k when the PI/O function setting flag (R7F5) is turned on, the bit for the total pulse frequency abnormality in the error display special internal output turns on, and none of the pulse outputs are output. In addition, individual setting of pulse outputs cannot be performed when the bit for the total pulse frequency abnormality is turned on.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF057:	a	Not used						b	c	d	e	f	g	h	i	

Figure 8.36 Special internal output for input/output function abnormality

Bit	Description of abnormality	Related terminal
a	Total pulse frequency abnormality	Y100 to Y103
b	Pulse 4 frequency abnormality	Y103
c	Pulse 3 frequency abnormality	Y102
d	Pulse 2 frequency abnormality	Y101
e	Pulse 1 frequency abnormality	Y100
f	Counter 4 preset value abnormality	X6
g	Counter 3 preset value abnormality	X4
h	Counter 2 preset value abnormality	X2
i	Counter 1 preset value abnormality	X0

(5) Individual setting of pulse outputs

It is possible to set the frequency and number of output pulses for each pulse output by the special internal outputs for individual setting, regardless of whether the CPU is operating or stopped. Turn on the corresponding bit in the following special internal outputs when only the pulse frequency or number of output pulses should be changed.

If the total of frequencies exceeds 5 kHz as a result of performing individual setting of pulse outputs for pulse outputs that are working normally, the bit for the error display special internal output that corresponds to the changed pulse output will turn on, and that pulse output will work at the frequency before the setting change. (The value set in the special internal output also returns to the previous value before the setting was made.)

8.6 Interrupt Input

When either operation mode 0, 1, or 3 is selected, it is possible to assign an interrupt input to X1, X3, X5, and X7 by the special internal output (WRF07F). (The 10-point type CPU does not have X7.) It is only possible to set them by the special internal output under the conditions where the CPU is stopped and the output is off.

When an interrupt input is entered, an interrupt process determined by a user program starts up. The INT numbers corresponding to the interrupt inputs are listed in Table 8.2. See the chapter about the instruction specifications for the interrupt input processing.

Table 8.3 Interrupt input – correspondence table

Interrupt input	Terminal	INT No.
Interrupt input 1	X1	INT16
Interrupt input 2	X3	INT17
Interrupt input 3	X5	INT18
Interrupt input 4	X7	INT19

8.7 Digital Filter

The input can set digital filter functions (when assigned normal input functions in X0 to X7 with operation mode 0, 1, or 3, be set to the input too). The sampling number of the digital filter is stored in the special internal output (WRF07F). The sampling number is set in 0.5ms unit (0 to 40, i.e., 0 to 20ms). When the value 0 is set, there is no filter, and when 41 or more is set, it is treated as a sampling number of 40 (20ms). This special internal output is stored in the FLASH memory by turning on the various setting write requests (R7F6). Once the setting is stored in the FLASH memory, it is not necessary to make the setting again when the power is turned on next time.

The input status is maintained in the buffer for the maximum sampling number. When the input status is read, the status for the past set number of sampling numbers is looked up, and if there was no change, that status is read. If there were changes, the status before the change is read.

WRF07F:

Input sampling number

Figure 8.38 Special internal output for setting normal input sampling number

The above-mentioned setting is stored immediately upon the completion of the setting. Moreover, it is invalid for inputs assigned to counter input.

8.8 Potentiometers

CPUs other than of the 10-point type are equipped with two potentiometers. Through the use of these potentiometers, it becomes possible to change values in the special internal outputs from the outside using a tool that looks like a screwdriver. The resolution is 10 bits, so it is possible to adjust the values from 0 to 3FFH (1 to 1,023). The potentiometers are found under the cover on the left side of the main unit. The value becomes larger when the dial is turned clockwise and smaller when turned counterclockwise. In addition, this value is always stored in the special internal output, regardless of whether the CPU is operating or stopped.

Figure 8.39 Potentiometers

(1) Values of the potentiometers

The values entered by means of the potentiometers are stored in the following special internal outputs.

WRF03E:	Potentiometer 1 input value
WRF03F:	Potentiometer 2 input value

Figure 8.40 Potentiometer input value storage special internal output

(2) Setting a filter for the potentiometer

The input values of the potentiometers fluctuate depending on the operating environment of the main unit etc. If the ratio of fluctuation is to be reduced, a sampling number can be set in the following special internal output. Once the sampling number is set, the average of the data obtained in the time period determined by the sampling number calculated by internal processing is set in WRF03E and WRF03F.

The sampling number can be set between 0 and 40 (0 to 28H). If 0 is set, the data without average is stored in WRF03E and WRF03F. If a value greater than 41 is set, the sampling number is treated as 40.

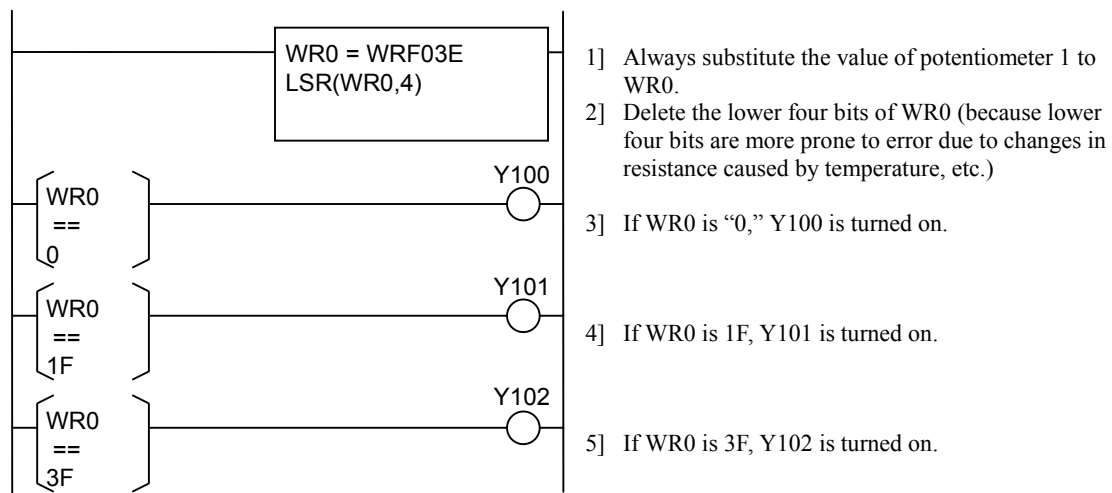

WRF06C:	Potentiometer 1 data sampling number
WRF06D:	Potentiometer 2 data sampling number

Figure 8.41 Special internal output for setting input data sampling number

This special internal output is stored in the FLASH memory by turning on various setting write requests (R7F6). Once it is stored in the memory, it is not necessary to set the value again when the power is turned on for the next time.

(3) Example

The following shows a simple ladder program using the potentiometers:

By turning potentiometer 1, one of flags Y100 to Y102 turns on.

8.9 Analogue Input

The 23-point type CPU is equipped with two points of analogue input. The input to these two points can be set to voltage input or current input individually. The setting of current or voltage input is made in the special internal output WRF06E. This special internal output is stored in the FLASH memory by turning on various setting write requests (R7F6). Once it is stored in the memory, it is not necessary to set the value again when the power is turned on for the next time.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF06E:	a	b	Not used													
Initial value:	0	0														

Figure 8.42 Special internal output for selecting the analogue type

WRF06E Setting value	Function	
	Analogue CH0 (Bit a)	Analogue CH1 (Bit b)
C000H	Current input	Current input
8000H	Current input	Voltage input
4000H	Voltage input	Current input
0000H	Voltage input	Voltage input

Please note that the external wiring is different for voltage input and current input. See the section regarding analogue system wiring for the details.

Through the above-mentioned settings, the input data of channel 0 is stored in WX 30 and the input data of channel 1 is stored in WX31. The correspondence between analogue data and digital data is shown in the figure 8.40 (divide 0 to 10 V and 0 to 20 mA in 0 to 4000). The voltage data is converted to 0.0025 [V] per 1H and the current data is converted to 0.005 [mA] per 1H. Therefore, the value ranges that can be measured from the output channel are 0 to 10.2375 [V] for voltage data and 0 to 20.475 [mA] for current data, respectively.

Figure 8.43 Correspondence diagrams of digital and analogue input

(Example)

If analogue input channel 0 is set to voltage input and the analogue input channel 1 is set to current input, and 3V and 14mA are applied respectively, 4B0H (1200) is stored in WX30 and AF0H (2800) is stored in WX31.

8.10 Analogue Output

The 23-point type CPU is equipped with one point of analogue output. In analogue output, digital values set at WY40 are converted to analogue output, and then output. Switching between voltage output/current output is performed by external wiring; analogue voltage outputs are output when connected to a voltage output terminal, and analogue current output when connected to a current output terminal.

The correspondence between analogue data and digital data is shown in the figure 8.41 (divide 0 to 10 V and 0 to 20 mA in 0 to 4000). The voltage data is converted to 0.0025 [V] per 1H and the current data is converted to 0.005 [mA] per 1H. Therefore, the values that can be output from the output channel are 0 to 10.2375 [V] for voltage data and 0 to 20.475 [mA] for current data, respectively.

Figure 8.44 Correspondence diagrams of digital and analogue output

(Example)

If 5F0H (1520) is set in WY40, 3.8 V is output from the analogue voltage output terminal. When reconnected to the analogue current output terminal, 7.6 mA is output. Please note that if connected to both terminals by mistake, the correct output value will not be output.

8.11 Analogue Expansion unit

Analogue expansion module has 4 ch. of analog input and 2 ch. of analog output, which is configured by dip switches.

Range setting

Analogue input range setting (Common for all input channels.)

Sw1	Sw2	Range	Remarks
off	off	0 - 10V	Default setting
off	ON	0 - ± 10 V	
ON	off	0 - 20mA	
ON	ON	4 - 20mA	

Analogue output range setting (Common for all output channels.)

Sw3	Sw4	Range	Remarks
off	off	0 - 10V	Default setting

Chapter 9 PLC Operation

The operating status and stop status of the MICRO-EH can be switched through various types of operations. This feature is shown in Figure 9.1.

Figure 9.1 Transitional diagram between operating and stop statuses

The MICRO-EH can be operated or stopped under the conditions as shown in Figure 9.1. If an error is detected during operation or stop, output is shut off, an error is displayed and the MICRO-EH stops. There are fatal error, serious error, minor error and warning. The operating status for each error is listed in Table 9.1.

Table 9.1 Description of each error and operating status

Classification	Description	Run/Stop
Fatal error	This indicates there is a fatal and unrecoverable error, such as a power supply problem, microcomputer error, system ROM error, system RAM error and system path error.	Stops
Serious error	This indicates there is an error such as data memory problem, system program problem, user memory problem, user memory size error, syntax/assembler error, etc., which may cause a malfunction if operation is continued.	Stops
Minor error	These are errors such as I/O information verify error, remote problem, congestion error, excessively assigned I/O points, etc. The operation may be continued when a continue operation is set by the user programs.	Stops (continued operation is possible if specified)
Warning	These are problems such as a transfer error, backup memory write problem, etc. where it is possible to continue the operation.	Operation continues

9.1 RUN Start

When the MICRO-EH switches to the operating state, the user program is executed in sequence from the beginning. The user programs consist of a normal scan program and periodical scan program. In addition to these programs, there is a subroutine area defined as a subroutine.

Table 9.2 Program classification

No.	Program classification	Description	Expression
1	Normal scan program	<p>This is the program that is normally executed. When the program has been executed to the END instruction, execution starts again from the beginning.</p> <p>Congestion error is monitored according to the congestion check time set by the user. It is monitored from the beginning of the program to the END instruction.</p> <p>When it is specified to continue during congestion (R7C0), the operation continues even if a congestion error occurs.</p>	
2	Periodical scan program	<p>This program is executed periodically at intervals of 10 ms, 20 ms, or 40 ms.</p> <p>INT0: Every 10 ms INT1: Every 20 ms INT2: Every 40 ms</p> <p>Each execution cycle time becomes a congestion error monitoring time.</p> <p>When it is specified to continue during congestion (R7C1), the periodical scan program is suspended during operation.</p>	<p>Described in the area after the END instruction.</p> <p>n = 0, 1, 2</p>
3	Interrupt scan program	<p>When there is an input to the input terminal assigned to the interrupt input, the interrupt program (INT16 to INT19) corresponding to that input starts up.</p> <p>If another interrupt caused by the same factor occurs during the execution of the interrupt program, a congestion error occurs. When the operation continuation at a congestion error (R7C2) is specified, the same interrupt scan program is run from the beginning again.</p>	<p>Described in the area after the END instruction</p> <p>n = 16 to 19</p>
		<p>If the counter value exceeds the preset value, a corresponding interrupt program (INT20 to INT27) starts up according to the counter number.</p>	<p>Described in the area after the END instruction</p> <p>n = 20 to 27</p>
4	Subroutine	<p>This is a program called by the CALL instruction.</p>	<p>Described in the area after the END instruction</p> <p>n = 0 to 99</p>

Each program is executed in the order of the priority shown in Figure 9.2. Each program is executed while monitoring the execution time of each program area. If the monitored time exceeds the specified time, this causes a congestion error and operation stops. When continued operation has been specified, operation continues.

The timing for scan execution is shown in Figure 9.2. System processing is performed at set periods (every 5 ms), followed by communication system processing. *1 The maximum execution time of communication system processing equals the duration of time until the next periodical system processing is started. If the communication system processing ends before the maximum execution time is up, execution of scan processing is started upon completion of the communication system processing. When the next periodical processing is executed, scanning is performed until the next periodical processing is executed.

*1: Communication system processing is executed every 10 ms.

*2: The execution of scan processing starts after the communication system processing is completed.

Figure 9.2 Relationship between system processing and scanning

Note: Processing 1 takes extremely short period of time as compared with Processing 2. Therefore, in the following diagram Processing 1 is omitted in order to avoid complexity.

As shown in Figure 9.3, scan processing is done while periodical scanning is performed. Periodical scanning is processed at the point when switching to normal scan. Periodical scans are performed at intervals of every 10 ms, 20 ms, or 40 ms. In terms of priority of execution, 10 ms scans have the highest priority. Use the refresh instruction when you wish to perform data processing for the external I/O (X, Y) in the periodical scan.

Update processing of timer progress value is performed as a part of system processing.

Figure 9.3 Scan execution timing

9.1.1 Normal Scan

(1) Definition and operation

The normal scan refers to the calculations and execution of the ladder/instruction language program (excluding interrupt programs) until the END scan processing caused by the END instruction or the execution of programs written in Pro-H. The time required for one scan, from the beginning of a normal scan program to the END scan processing, is called the normal scan time.

Figure 9.4 Operation of normal scan

(2) Causes of congestion errors at normal scan

Congestion errors may occur at normal scan because of the following three possible reasons. In particular when using a periodical scan program and an interrupt scan program together, care must be taken to create the program in such a way that the total scan time does not exceed the congestion check time.

(a) When only a normal scan program is used

The scan time exceeded the congestion check time because the time required for one scan was too long.

Figure 9.5 Congestion error at normal scan (a)

(b) When both a normal scan program and a periodical scan program are used

The congestion check time was exceeded because the periodical scan program was executed and the normal scan time became longer.

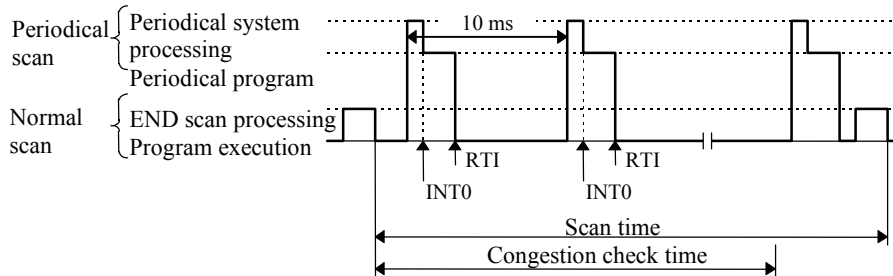

Figure 9.6 Congestion error at normal scan (b)

(c) When both a normal scan program and an interrupt scan program are used

The congestion check time was exceeded because the interrupt scan program was executed due to an interrupt input and the normal scan time became longer.

Figure 9.7 Congestion error at normal scan (c)

(3) Continuation of operation after a congestion error occurred

When the special internal output bit R7C0, which specifies whether the operation should continue after a congestion error occurred, is turned on, the normal scan executes the scan until the end regardless of the congestion check time, and after executing the END scan processing, executes the normal scan from the beginning again.

Figure 9.8 Operation when operation continuation at congestion error is set

However, note that this setting does not stop the execution of the scan when a congestion error occurred even when an infinite loop is formed within the normal scan by the JMP instruction.

9.1.2 Periodical Scan

(1) Definition and operation

This scan executes interrupt programs (periodical scan programs) while the CPU is operating with a fixed cycle time (10 ms, 20 ms, or 40 ms) specified by the users.

Enter the periodical scan program to be executed between instructions INT0 and RT1 if it should be started up with a 10 ms cycle time, and between INT1 and RT1 if it should be started up with a 20 ms cycle time.

The periodical system processing is executed every 10 ms regardless of whether or not there is a periodical scan program.

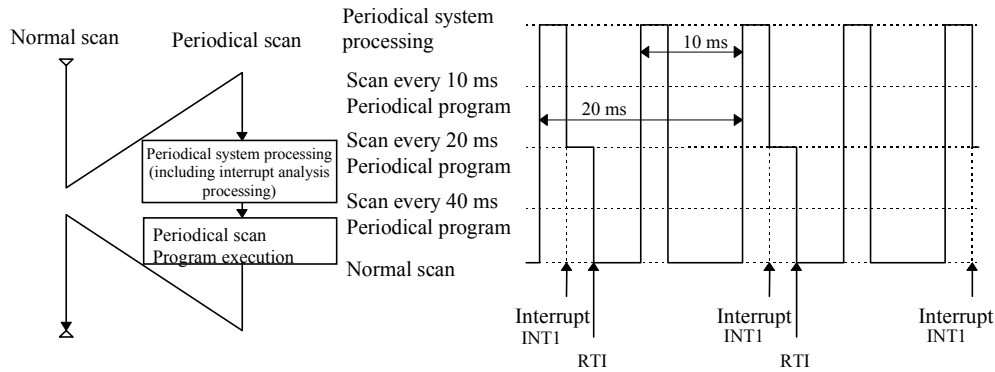

Figure 9.9 Operation of periodical scan (in case of INT1)

(2) Causes of congestion errors at periodical scan

If there are periodical scans at every 10 ms as well as scans at every 20 ms or 40 ms, a congestion error occurs and the scan is stopped if the periodical scan at 10 ms is started up again before all the periodical scans are completed (i.e., the periodical system processing at INT0 to INT2 does not end within 10 ms).

Figure 9.10 Congestion error at periodical scan (10 ms)

Similarly, when executing with a periodical scan at every 20 ms or with a combination of periodical scans at every 20 ms and 40 ms, a congestion error occurs if the periodical scan at 20 ms is started up again before all the periodical scans are completed (i.e., the periodical system processing at INT1 to INT2 does not end within 20 ms). Finally, when using a periodical scan at every 40 ms, a congestion error occurs if the periodical scan at 40 ms is started up again before all the periodical scans are completed (i.e., the periodical system processing at INT2 does not end within 40 ms).

(3) Continuation of operation after a congestion error

If a congestion error occurs when the special internal output bit R7C1, which specifies whether the operation should continue after a congestion error, is turned on, the execution of the periodical scan is stopped and the periodical scan is executed from the beginning again. If the operation continuation specification for the normal scan is Off when this happens, the scan stops as a congestion error at a normal scan. If the operation continuation specification for the normal scan is On, only the periodical scan continues to be executed in the event of a periodical congestion error. Care must be taken because the normal scan is not executed under this condition.

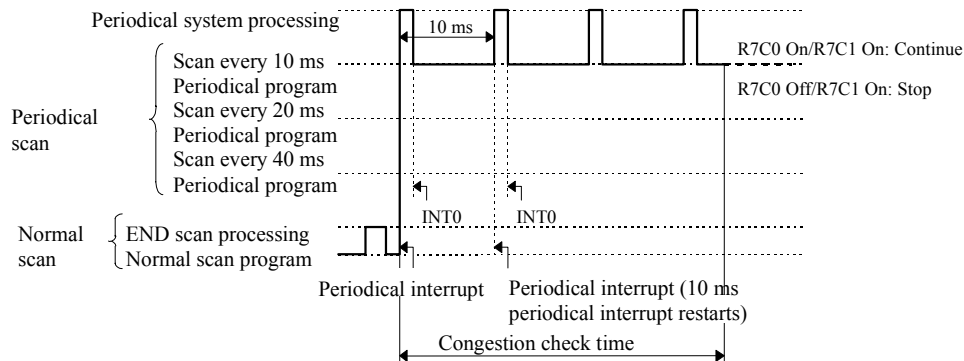

Figure 9.11 Operation when operation continuation at congestion error is set

9.1.3 Interrupt Scan

(1) Definition and operation

If there is an input to an input terminal assigned to an interrupt input, or there is an input to an input terminal assigned to a counter input and the current counter value exceeds the preset value while the CPU is operating, interrupt programs (interrupt scan) corresponding to them are started up. An interrupt scan caused by an interrupt input executes interrupt programs from INT16 to RTI instructions. An interrupt scan due to a corresponding interrupt caused by the counter current value executes the interrupt programs from INT20 to INT27 to RTI instruction.

If an interrupt caused by another factor is input during the execution of an interrupt scan, the next interrupt scan is started up at the point when the interrupt scan being executed is completed. Also, if two or more interrupts are input during the execution of an interrupt scan, the interrupt scans are started up in order from the smallest INT number at the point when the interrupt scan being executed is completed.

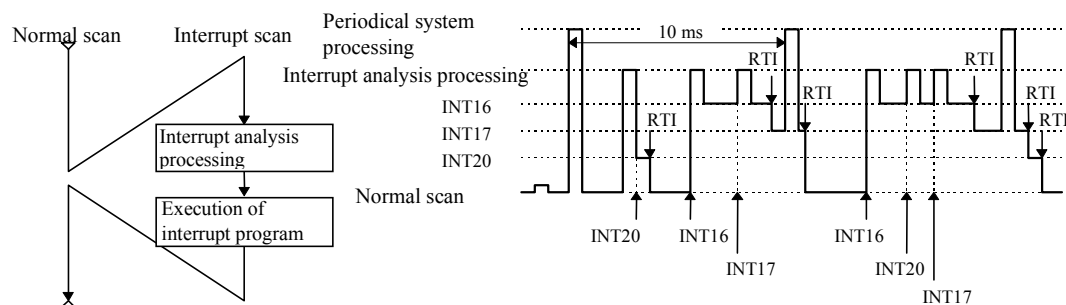

Figure 9.12 Operation of interrupt scan

(2) Causes of congestion errors at interrupt scan

An interrupt scan congestion error occurs during the interrupt scan processing when an interrupt of the same number is entered again.

In addition, a normal scan congestion error occurs if interrupt inputs are frequently entered because a normal scan cannot be executed.

Figure 9.13 Operation of interrupt scan

(3) Continuation of operation after a congestion error occurred

If an interrupt scan congestion error occurs when the special internal output bit R7C2, which specifies whether the operation should continue after a congestion error, is turned on, the interrupt scan is started anew and the scan is executed from the beginning again. Therefore, if the operation continuation specification of the normal scan is Off under the conditions where interrupt inputs are frequently entered from the external source, this scan is stopped as a normal scan congestion error. If the operation continuation specification of the normal scan is On, only interrupt scans are continuously executed depending on the condition of the interrupt congestion error. Care must be taken because normal scans are not executed under this condition.

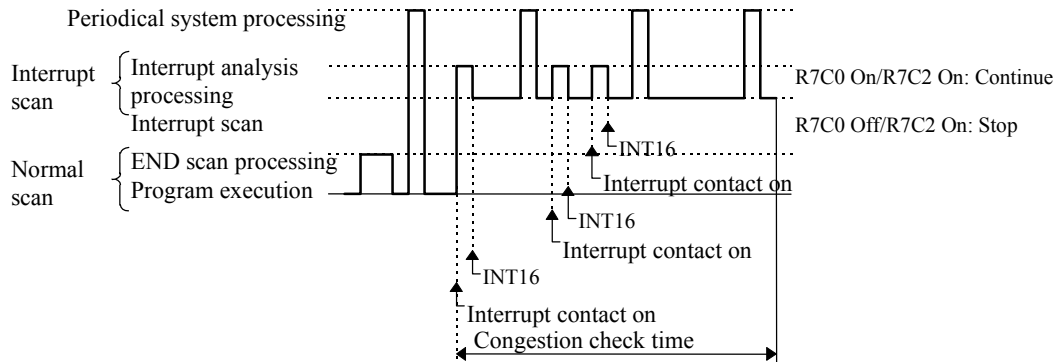

Figure 9.14 Operation when operation continuation at congestion error is set

9.1.4 Relationship of Each Scan Type

When three types of scan occur at the same time, scan is executed in the order of periodical scan, then interrupt scan, and then normal scan.

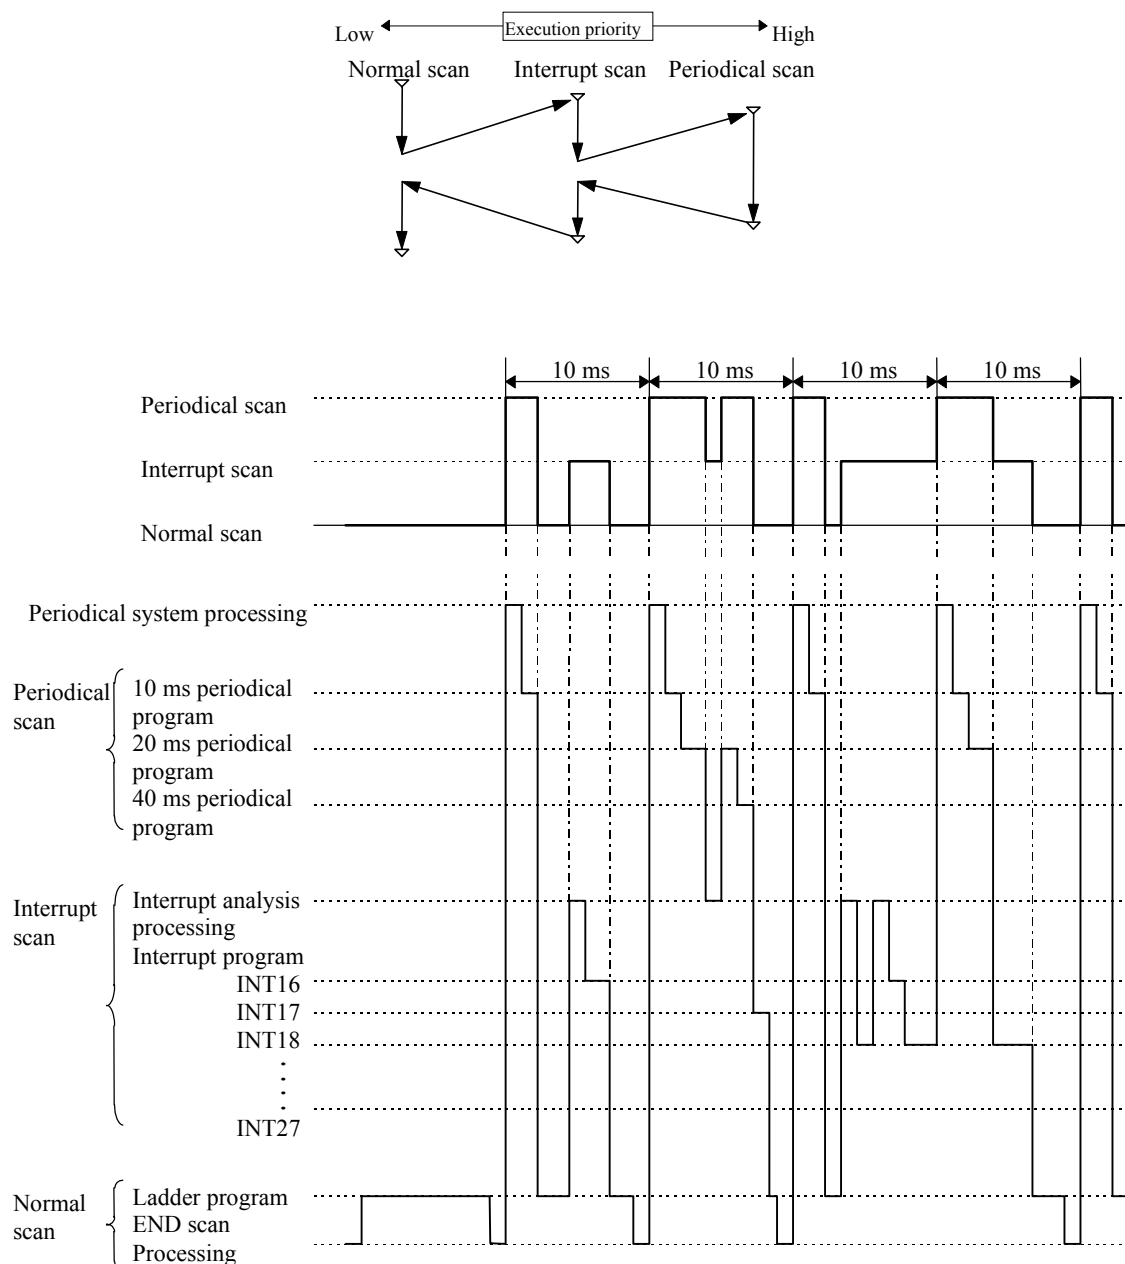

Figure 9.15 Relational diagram of scan operation

Table 9.3 List of interrupt label

Interrupt label	Cause of startup	Interrupt label	Cause of startup
INT0	Interrupt every 10 ms	INT20	Counter 1 on-preset match
INT1	Interrupt every 20 ms	INT21	Counter 1 off-preset match
INT2	Interrupt every 40 ms	INT22	Counter 2 on-preset match
INT16	Interrupt of interrupt input 1	INT23	Counter 2 off-preset match
INT17	Interrupt of interrupt input 2	INT24	Counter 3 on-preset match
INT18	Interrupt of interrupt input 3	INT25	Counter 3 off-preset match
INT19	Interrupt of interrupt input 4	INT26	Counter 4 on-preset match
		INT27	Counter 4 off-preset match

9.2 Online Change in RUN

The user programs can be modified during operation while retaining the output status as is. This is called the “program change while running” function. To modify the user programs, special programming software or programmer is required. Refer to the individual manuals on the operation.

Program change while running cannot be executed in the following situations. Perform this operation after satisfying the conditions.

Table 9.4 Conditions for performing program change while running

No	Conditions under which program change while running cannot be performed	Specific situation	How to satisfy the conditions
1	When READ-occupying	Other programming device is connected.	Change other programming devices to off-line.
2		When a personal computer or panel, etc. is connected and monitoring is being executed.	Change the personal computer or panel to off-line. (When monitoring, it is convenient to use the occupancy unnecessary task code.)
3	END instruction is not executed.	A program that runs in an infinite loop is being executed.	Correct the program so that it does not run in an infinite loop.
4	Attempted to modify a program that includes control instructions.	Performing program change while running for a circuit containing a control instruction may cause operation to stop depending on the type of the program modification error.	An explanation of how to perform program change while running for a circuit that contains a control instruction is given in the programming software manual.
5	A password has been set.	A program protected by a password cannot be modified.	Execute after having the system administrator remove the password.

(When the CPU is stopped, the update is executed without displaying a message confirming program change while running.)

The MICRO-EH operation when the user program is changed in RUN is shown below.

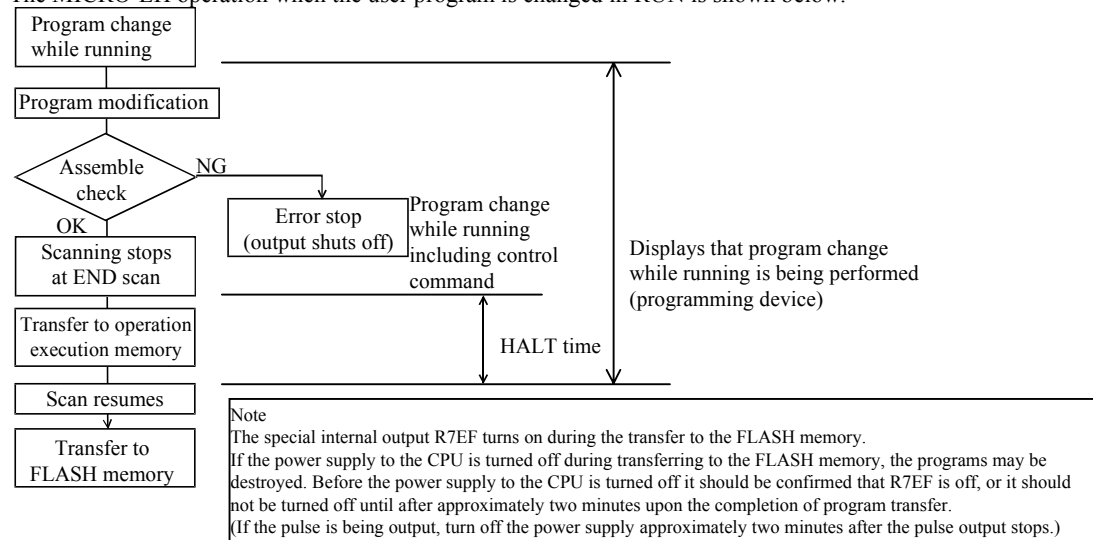

Figure 9.16 Internal processing for program change while running

Transfer to the FLASH memory

Unlike the conventional H/EH series, the MICRO-EH transfers its user program to the FLASH memory, the backup memory, during the idle time of the CPU processing. Because of this, when the transfer to the operation execution memory is completed, the peripheral unit displays that the transfer is complete. However, the transfer to the FLASH memory is not completed at this stage. If the power supply to the CPU (especially CPUs without battery or CPUs whose data maintenance guarantee time is over) is turned off at this status, a user memory error (31H) occurs when the power supply to the main unit is turned back on. Therefore, it should be confirmed that the FLASH memory writing flag (R7EF) is off before the power supply to the main unit is turned off, or it should not be turned off until after approximately two minutes upon the completion of program transfer. (During pulse output, programs are not transferred to the FLASH memory until the pulse output is stopped. If the pulse is being output, turn off the power supply approximately two minutes after the pulse output stops.)

CPU HALT time

When performing program change while running, the program to be written to the CPU is checked if there are no errors, then the CPU is halted temporarily (RUN → HALT).

The program of the modified area is written to the CPU while it is halted, and the CPU is set to operate (HALT → RUN) again.

At this time, the following equation shows the approximate time the CPU is halted (it is not necessarily the maximum value).

$$\text{HALT time (ms)} = 45 \times \text{Program capacity (k steps)} + 20$$

An example of a calculation of the HALT time for the MICRO-EH using the above equation is 155 ms.

9.3 Instantaneous Power Failure

The following shows operation when the power supply to the MICRO-EH shuts off.

(1) Powering on

The MICRO-EH starts operations after a maximum of 3.5 seconds have elapsed after power-up. If the power for input module is not completely started when the operation is commenced, the input that is supposed to be on will be received as Off and operation proceeds, so make sure that the power for I/O module is completely turned on before operation is commenced.

Note: When extending with a CPU larger than 14-point type, turn on the power supply for both base and extension sides at the same time.

(2) Instantaneous power failure actions

- (a) When 100 VAC is supplied
Operation is continued during instantaneous power failures that last less than 10 ms.
- (b) When 200 VAC is supplied
Operation is continued during instantaneous power failure that last less than 20 ms.

Note: Make arrangement so that the power for input module is supplied while the CPU continues its operation. If the power is not supplied, the CPU will perform operation assuming the input data as Off. Exercise caution especially when performing operation that changes the contents of the power failure memory using input signals, since the contents of the power failure memory may have been altered unintentionally due to an instantaneous power failure.

9.4 Operation Parameter

The settings of “parameters,” which are required to perform tasks such as creating programs, transferring programs to the CPU, are performed. The setting contents are explained below.

Item	Function	Description	When to use the function
1	Password	<ul style="list-style-type: none"> ○ Register a password to a program in the four-digit hexadecimal format. The program with a password will not allow program operation nor changes unless the correct password is entered, so please exercise caution. <u>Note: The user will not be able to reset the password when it is forgotten, so exercise extreme caution when accessing a password.</u> Password is not set at the time of shipment. 	Use to protect the confidentiality of the programs.
2	CPU type	<ul style="list-style-type: none"> ○ Set the CPU name used to perform programming. Set the CPU type to “H-302” for MICRO-EH. 	Always perform these settings when programming.
3	Memory assignment	<ul style="list-style-type: none"> ○ Set the memory capacity. Set the memory type to “RAM-04H” for MICRO-EH. 	Always perform these settings when programming. The number of program steps that can be input is 3072.
4	Operating parameters	<ul style="list-style-type: none"> ○ Operation control Perform these settings when controlling the running and stopping of the operation using a specific I/O. If this is not set, operation will start automatically by setting the RUN switch (or the RUN terminal) to “RUN.” ○ Congestion check time Set this when you wish to stop the CPU operation when the set maximum processing time for a normal scan is exceeded. When this setting is not made, this is automatically set to initial value 100 ms. ○ Operating mode at problem occurrence Set this when you wish to continue the CPU operation when the error generated by the CPU is minor. 	Set according to the user's operation purposes.
5	I/O assignment	<ul style="list-style-type: none"> ○ This sets the I/O assignment information of the CPU. It is convenient to use the MICRO-EH's I/O assignment copy function. 	Always perform these settings when programming.
6	Program name	Set the program name using a maximum of 16 alphanumeric characters. The set program names can be written into the CPU along with the program, which will facilitate the program verification and management.	Set this to facilitate program verification and management.
7	Power failure memory*	This sets the range in which the data in a specified area in the CPU is to be stored upon CPU power off or when commencing RUN. Settings for R, WR, WM, TD, DIF, DFN are possible.	Set this when there is data you wish to maintain when operation is stopped. The special internal output data is unconditionally saved for power failure by the I/O number.

*: 10-point type CPU does not have the power failure memory function. Even though it is possible to set a power failure memory area from a peripheral unit, the values that are stored here will not be persistent; **do not set this function.**

Moreover, 14-point type CPU can maintain power failure memory only up to 72 hours. Note that non-persistent values will be stored if the power supply to the main unit is not turned on after these hours have passed. 23- and 28-point CPUs without a battery can maintain power failure memory for only up to 30 minutes. The data can be retained for approximately two months by installing a battery.

9.5 Test Operation

- (1) **Verification of interlock**
Verify performance of the interlock in case of unexpected incidents.
Create ladders such as an emergency stop circuit, protective circuit and interlock circuit outside the program controller. For the relay output module, however, do not control the relay drive power supply to interlock with the external loads.
- (2) **Operation without load**
Before actually operating the loads in the system, test the program only and verify its operation.
Always perform this if there may damage the other party's equipment due to unexpected operation caused by program errors or other problems.
- (3) **Operation using actual loads**
Supply power to the external input and external output to verify the actions.

9.6 Forced Set/Reset

It is possible to forcefully set/reset data to specified I/O points using peripheral units, regardless of whether the CPU is operating or stopped. Refer to the manuals for the peripheral units for how to set/reset forcefully.
Please note that for the special internal outputs related to operation modes, forcefully setting/resetting only the corresponding special internal output does not enforce the change in the operation mode. For example, when the frequency of a pulse output should be changed, the frequency will not be changed by just setting the desirable frequency in WRF072, the special internal output for setting pulse frequency. See Chapter 8, where the setting of the PI/O function is explained in detail.

9.7 Forced Output

It is possible to use peripheral units to specify single outputs for forced output while the CPU is stopped. Refer to the manuals for the peripheral units for how to output forcefully.
Table 9.5 lists the differences between the forced set/reset and forced output.

Table 9.5 Differences between forced set/reset and forced output

	Forced set/reset	Forced output
I/O types that can be used	X,Y,M,R,TD,SS,CU, CT,WX,WY, WM,WR, TC,DX,DY,DM,DR	Y,WY,DY
CPU status in which the function can be used	During RUN and being stopped	Being stopped
Function	Changes the data in the area that stores the CPU calculation result to a specified value.	Turns only one specified external output (one point or one data) on/off while the CPU is being stopped. All other outputs are turned off.
Application	For checking when setting/changing power failure memory area data at troubles.	For checking the wiring for external output.

Note:

- 1] The actual external output status and the external output information stored internally in the CPU may be different when the CPU is stopped. At this point, if a forced set/reset is performed to the external output, the external output information stored internally in the CPU is output from other external output. Thus, the forced output function can be used in order to check the wiring for the external output.
- 2] Only I/O points assigned by the I/O assignment written in the CPU can be set for external input and external output I/O numbers.

Chapter 10 PLC Installation, Mounting, Wiring

10.1 Installation

- (1) Installation location and environment
 - (a) When installing the MICRO-EH, use the unit under the environment within the general specification.
 - (b) Mount the PLC onto a metal plate.
 - (c) Install the PLC in a suitable enclosure such as a cabinet that opens with a key, tool, etc.
- (2) Installing the unit
 - (a) Precautions when installing the unit
 - 1] When installing the base unit, fix it securely with screws in 2 places (M4, length 20 mm or more) or DIN rail.
 - 2] To use the unit within the ambient temperature range,
 - a) Allow ample space for air circulation. (50 mm or more at top and bottom, 10 mm or more to the left and right)
 - b) Avoid installing the unit directly above equipment that generates significant heat (heater, transformer, large-capacity resistance, etc.)
 - c) When the ambient temperature reaches more than 55 °C, install a fan or cooler to lower the temperature to below 55 °C.
 - 3] Avoid mounting inside a panel where high-voltage equipment is installed.
 - 4] Install 200 mm or more away from high-voltage lines or power lines.
 - 5] Avoid upside down, vertical or horizontal mounting.

Figure 10.1 Mounting clearances

Figure 10.2 External dimensions

Dimensional table

Unit	L1	L2
10-point	65	70
14-point (basic, exp.)	85	80
23, 28-point (basic, exp.)	140	80

Unit: mm

- (b) Mounting to a DIN rail
 - Attaching to a DIN rail

- 1] Hook the claw (top side) attached to the back of the unit to the DIN rail.
- 2] Press the unit into the DIN rail until it clicks.

Note: After installation, check to make sure the base unit is securely fixed.

Securing the unit

Secure the unit by installing DIN rail fixing brackets from both sides. (The product may move out of place if not secured with the fixing brackets.)

Removing the unit from the DIN rail

While lowering the DIN rail attachment mounting lever 1], lift the unit upward to remove as shown by 2].

10.2 Wiring

(1) Separation of the power system

The power supplies include power for the MICRO-EH main unit/power for the I/O signals/power for general equipment. These power supplies should be wired from separate systems as much as possible. When these power supplies are supplied from one main power source, separate the wiring with a transformer or similar device, so that each power supply is a separate system.

Figure 10.3 Example of power system diagram

(2) Regarding fail safe

1] Construct an interlock circuit external to the MICRO-EH.

When the MICRO-EH's power is turned on or off, the inputs/outputs of the MICRO-EH may not temporarily operate normally due to the time lag of the power supply of the MICRO-EH's main unit, the external power supply of the MICRO-EH's expansion unit, and the external power supply (especially DC power supply) for the MICRO-EH's I/O signals, as well as the difference in their startup times.

Thus, either turn on the power to the expansion unit first, or turn on the power to both the base unit and expansion unit simultaneously. Also, be sure to turn on the external power supply (especially DC power supply) for the MICRO-EH's I/O signals before turning on the MICRO-EH.

Additionally, a problem in the external power supply or a malfunction in the MICRO-EH's main unit may cause abnormal operations. To prevent such problems from causing abnormal operations of the entire system, and from the viewpoint of creating a fail-safe mechanism, construct such circuits as an emergency stop circuit, protective circuit and interlock circuit external to the MICRO-EH for the sections that may result in mechanical damage or accident if abnormal operations occur.

2] Install a lightning arrester

To prevent damage to the equipment as a result of being struck by lightning, it is recommended that a lightning arrester be installed for each MICRO-EH's power supply circuit.

The MICRO-EH detects a power failure from a voltage drop in the internal 5 VDC power supply. For this reason, when the load in the unit's internal 5 VDC system is light, 5 VDC is retained for a long period of time and operations may continue for more than 100 ms. Thus, when an AC input unit is used, an off-delay timer for coordinating with the internal 5 VDC system is required to avoid erroneous input since the AC input signal turns off more quickly than the internal 5 VDC system.

(3) Wiring to the power module

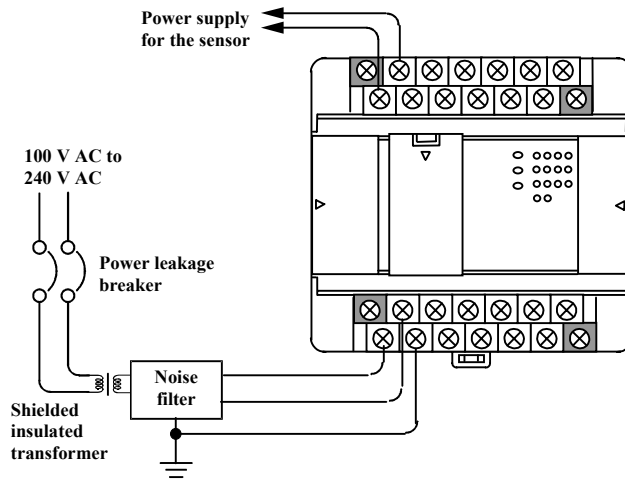

Figure 10.4 Power supply wiring diagram

- (a) For power supply wiring, use a cable of 2 mm² or more to prevent a voltage drop from occurring.
- (b) For the function ground terminal (PE terminal), use a cable of 2 mm² or more and provide Class D grounding (100 Ω or less). The appropriate length for the ground cable is within 20 m.
 - 1] Instrumentation panel and relay panel grounding may be shared.
 - 2] Avoid grounding shared with equipment that may generate noise such as high-frequency heating furnace, large-scaled power panel (several kW or more), thyristor exchanger, electric welders, etc.
 - 3] Connect a noise filter (NF) to the power cable.
- (c) Tighten the terminal screws within the torque range as shown below.

Unit	Screw	Clamping torque
10-point	M2.5	0.3 to 0.4 N·m
14, 23, 28-point, expansion	M3.0	0.5 to 0.6 N·m

- (d) Use the same power supply system for the basic and expansion units.

(4) Wiring cable for I/O signals

Tighten each terminal screw using a torque of the specified torque range.

When using a crimp terminal, use one with an outer diameter of 6 mm or less.

Use only up to two crimp terminals in the same terminal. Avoid clamping down more than three at the same time.

Only one piece of cable can be wired per terminal if the cable type is between AWG14 and AWG22 (cable thickness ranging between 2.1 mm² and 0.36 mm²), but two pieces can be wired if the cable type is between AWG16 and AWG22 (between 1.3 mm² and 0.36 mm²).

(5) Wiring to the input terminals

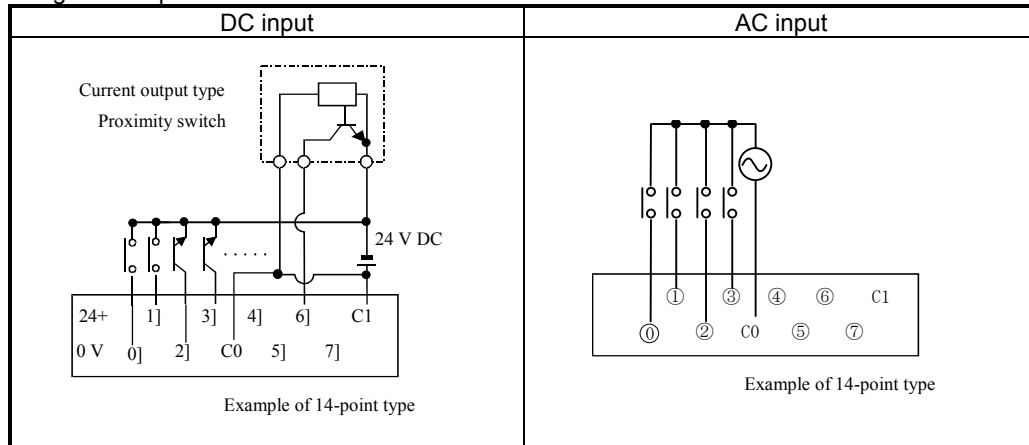

Figure 10.5 Input wiring

(a) DC input

- 1] When all input terminals (X0, X1, ...) and the common terminal (C) are loaded with 24 VDC, the input becomes ON status, and approximately 7.5 mA of current flows to the external input contacts.
- 2] For sensors such as a proximity switch or photoelectric switch, current output type (transistor open collector) can be connected directly. For voltage-output-type sensors, connect them to the input terminal after first going through the transistor.
- 3] Take measures to prevent faulty contact in a strong electric contact.

The current that flows to a contact when external contacts are closed is approximately 7.5 mA. If a strong electric contact must be used, add resistance as shown in the diagram at left and supply sufficient current to the contact to prevent a faulty contact.

- 4] Limit the wiring length within 30 m.
- 5] Multiple number of common terminals located at each input section are not connected internally. Make the connections externally as needed.
- 6] There are no RUN and STOP switches for the 10-point type. Connect with the RUN input terminal according to the above connection procedure so that RUN and STOP can be performed. Operation cannot be performed unless this connection is done.

(b) AC input

In case of AC input module, input voltage may exist if input wiring is long although no device drives. This phenomenon is caused from leakage current due to floating capacitance between lines.

The countermeasures are [1] or [2] as follows. This voltage due to electrostatic coupling must be half of max. OFF voltage or less.

- [1] To install dummy resistor in parallel so that impedance of input module is lower.
- [2] To replace power supply at drive (external device) side.

(6) Wiring to the output terminals

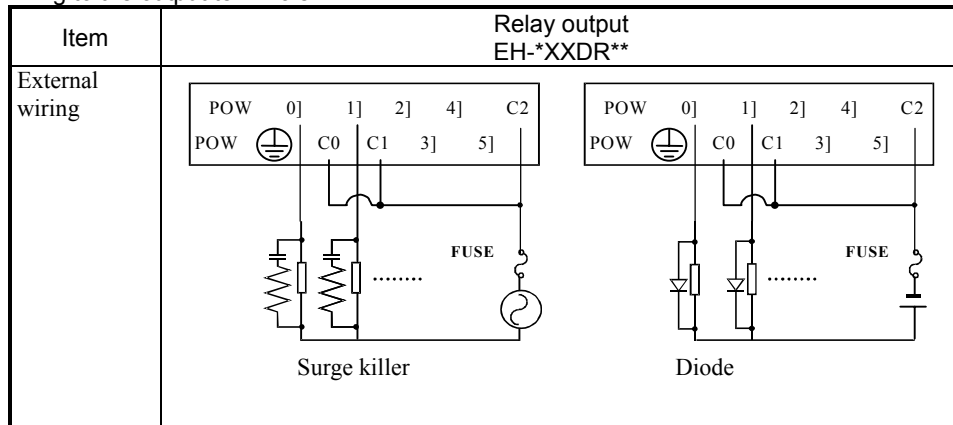

Figure 10.6 Relay output wiring

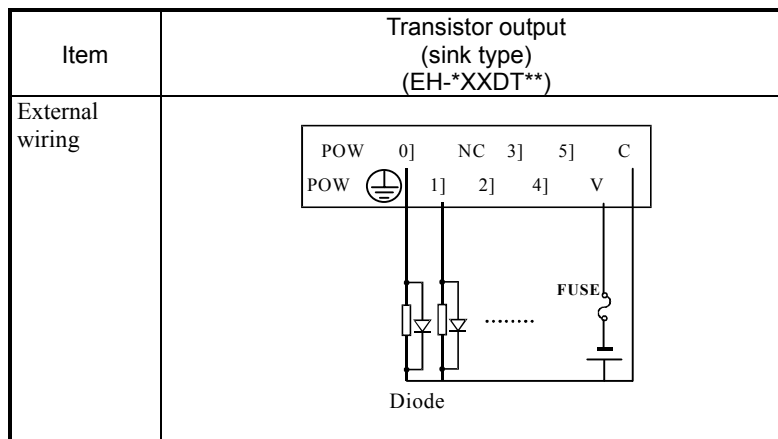

Figure 10.7 Transistor output wiring

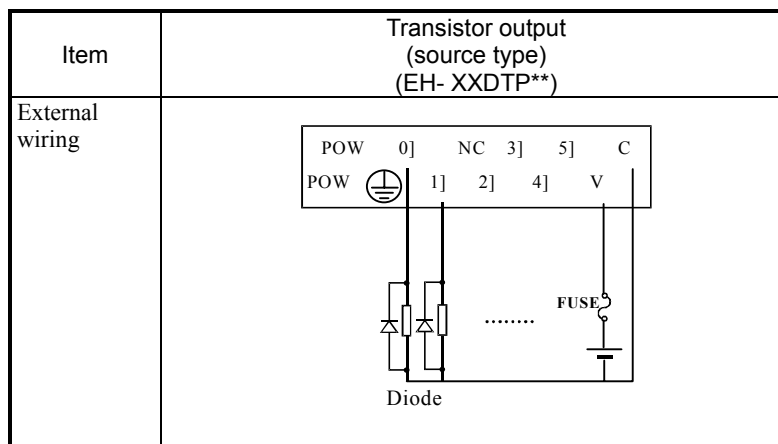

Figure 10.8 Transistor output wiring

- (a) Wiring to the relay output terminals
1] Life of relay contacts

Life curve of relay contacts

Figure 1 Life characteristics (125 V AC)

Life of the contact is almost in squared reverse proportion to the current, so be aware that interrupting rush current or directly driving the condenser load will drastically reduce the life of the relay. When switching is made with high frequency, use a transistor output module.

Figure 2 Life characteristics (250 V AC)

Figure 3 Life characteristics

- 2] Surge killer

For inductive load, connect a surge killer (condenser 0.1 μ F, + resistance of approx. 100 Ω) in parallel to the load. Also, for DC load, connect a flywheel diode.

- 3] Fuse

A built-in fuse is not used in this module. Install a 6 A fuse in the common to prevent the external wiring from burning out.

For the independent contact output section, install a 2A fuse per circuit.

- (b) Wiring to the transistor output terminals

- 4] Flywheel diode

For inductive load, connect a flywheel diode in parallel.

- 5] V and C terminals

Always connect a V terminal and C (common) terminal. If the module is used without connecting these terminals, the internal flywheel diode may not function and the module may malfunction or break down.

- 6] Fuse

There is no built-in fuse to prevent external wiring burning. Therefore, it is recommended that a fuse be installed externally to prevent the external wiring from burning out. (This does not protect the internal transistor elements.) If the external load is short-circuited, please contact us for repair.

(7) Wiring to the unit terminals

Figure 10.9 Example of wiring

(8) Wiring to the analog I/O terminals

- Do not apply the voltage that exceeds the rated input voltage to the analog input terminals. In addition, do not allow the current that exceeds the rated input current to flow into the analog input terminals. If a power supply that is different from the specified power supply is connected, the product may be damaged or burned out.
- For the channels that do not use the analog input terminals, be sure to short-circuit the analog input terminals before using such channels.
- For the external wiring to the analog I/O terminals, use a shielded cable and make routing different from other power lines with different voltages and signal lines. In addition, ground one end of the shield cable. However, grounding both ends or open ends may have better effect than grounding one end of the shield cable, depending on the noise environment in which the equipment is used. Use the appropriate grounding method accordingly.
- Place AC power supply lines, signal lines and data lines in separate pipes.
- Wire signal lines and data lines as close as possible to a grounded surface such as a cabinet and metal bar.

Chapter 11 Communication Specifications

11.1 Port function

Port function of MICRO-EH is shown in Table 11.1.

Table 11.1 Communication port specification

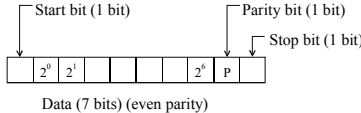

Port type		RS-232C			RS-422/485				
		Dedicated port		General purpose port	Dedicated port				General purpose port
					Transmission procedure 1		Transmission procedure 2		
							Without St. No. (1:1)	With St. No. (1:N)	
Connected devices		Programming device, PC, modem, HMI	PC, etc.		PC, etc.	Programming device, PC, HMI	PC, etc.	PC, etc.	
Port 1	All modules	✓	✓	✓*	-	-	-	-	-
Port 2	23,28 pts. module	-	-	-	✓	✓	✓	✓	✓*

* Supported by software version 1.30 (WRF051=H0130) or newer.

11.2 Port 1

Specification of port 1 is shown below.

Table 11.1 Port 1 specification

Item	Specification		
Communication speed*	Dedicated (programming) port	Modem mode	General purpose port
	4800, 9600, 19.2k, 38.4k bps	2400, 4800, 9600, 19.2 k, 38.4k, 57.6 k bps	300, 600, 1200, 2400, 4800, 9600, 19.2k, 38.4k, 57.6k bps
Communication system	Half duplex		
Synchronization	Asynchronous		
Startup system	One-sided startup using the host side command		
Transmission system	Serial transmission (bit serial transmission)		
Transmission code	ASCII		Configured by user
Transmission code configuration	ASCII: 7-bit data, 1 start, 1 stop, even parity  Data (7 bits) (even parity)		Configured by user
Data sending sequence	Sent out from the lowest bit		
Error control	Vertical parity check, checksum, overrun check, framing check		
Transmission unit	Message unit (variable length)		
Max. message length	1,024 bytes (including control characters)		
Control procedure	H-series dedicated procedure (hi-protocol) Standard protocol (transmission control procedure 1), Simplified protocol (transmission control procedure 2)		Configured by user
Interface	RS-232C (maximum cable length: 15 m)		
Connector	8P modular connector (RJ45)		

* : Handy programmers are not available with MICRO-EH.

* : GPCL01H is not available with 10 points type as communication speed is fixed as 4,800 bps.

* : If host sends NAK command, the next message must be sent after 10 ms interval.

(1) Port 1 settings

Port 1 is configured by combination of DIP switch and special register (WRF01A).

DIP switch can be set when cable is not connected (DR signal is off). Switch configuration is set at cable connected (DR is high).

Value in WRF01A is saved in FLASH memory when writing flag (R7F6) is turned on. If saved in FLASH memory, it is not necessary to set again at the next power up.

[Caution] If transmission procedure 2 is configured and saved in FLASH memory once, peripheral device/application which supports procedure 1 such as LADDER EDITOR can not be connected.

ON

1

	38.4 k bps					H0300 : Prcd. 1 / H8300 : Prcd. 2	
	57.6 k bps					H0400 : Prcd. 1 / H8400 : Prcd. 2	
	2400 bps					H0500 : Prcd. 1 / H8500 : Prcd. 2	
	General purpose port					Port switching by FUN5 command , Baud rate by TRNS/RCV command	

* Due to no DIP switch equipped, 10 points type does not support modem function.

* +12V is supplied from pin 4 if DIP switch is ON.

* General purpose port is supported by software version 0130 (WRF051=H0130) or newer.

(2) Port 1 hardware

The circuit diagram of port 1 and the signal list are shown in Figure 11.2 and Table 11.3 respectively.

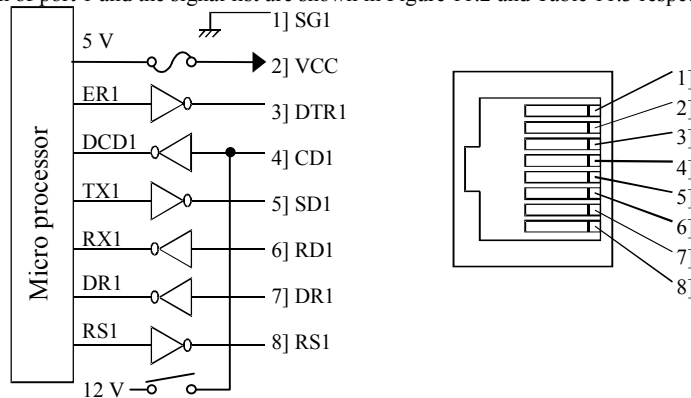

Figure 11.2 Circuit diagram and pin numbers for port 1

Table 11.3 List of port 1 signals

Pin No.	Signal abbreviation	Direction		Meaning
		CPU	Host	
1]	SG1	←→		Signal ground
2]	VCC	→		5 V DC is supplied. (Protective fuse is connected.)
3]	DTR1 (ER)	→		Communication enabled signal. When it is high, communication is possible.
4]	CD1 (DCD)	→		12V is output when DIP switch 1 is on.
5]	SD1 (TXD)	→		Data sent by the CPU
6]	RD1 (RXD)	←		Data received by the CPU
7]	DR1 (DSR)	←		Peripheral units connected signal. When it is high, peripheral device is connected.
8]	RS1 (RTS)	→		Transmission request signal. When it is high, CPU is ready to receive data.

11.3 Port 2

The specifications of port 2 are listed in Table 11.4. 1:n station communication by the high protocol is possible with port 2. By creating and including a control procedure based on the high protocol on the personal computer which will become the host, it becomes possible to control a maximum of 32 stations from one host. The systems can thus be configured in several ways.

Table 11.4 Port 2 specifications

Item	Specification	
Communication speed	Dedicated (programming) port	General purpose port
	4800, 9600, 19.2 k, 38.4 k bps	300, 600, 1200, 2400, 4800, 9600, 19.2 k, 38.4 k, 57.6 k bps
Communication system	Half duplex	
Synchronization	Asynchronous	
Startup system	One-sided startup using the host side command	
Transmission system	Serial transmission (bit serial transmission)	
Transmission code, configuration	ASCII: 7-bit data, 1 start, 1 stop, even parity	Configured by user
Transmission code outgoing sequence	Sent out from the lowest bit in character units	
Error control	Vertical parity check, checksum, overrun check, framing check	
Transmission unit	Message unit (variable length)	
Maximum message length	503 bytes (including control characters) Note: 505 bytes when the station number is used.	1,024 bytes
Control procedure	H-series dedicated procedure (h-protocol) Standard protocol (transmission control procedure 1), Simplified protocol (transmission control procedure 2)	Configured by user
Interface	RS-422/485 (maximum cable length: 250 m)	
Connector	CPU side: 15-pin D-sub Cable side: a cable equivalent to 17JE-23150-02(D8B) (DDK Co., Ltd.) is recommended (D-SUB fitting screw M3 × 0.5)	

(1) Setting port 2

Port 2 is configured by special register WRF03D. The settings can be changed even when port 2 is communicating. The highest bit (b15) of WRF03D is setting bit.

If station number mode is used, make sure to set the station number from 0 to 31 in BCD code.

Value in WRF03D is saved in FLASH memory when writing flag (R7F6) is turned on. If saved in FLASH memory, it is not necessary to set again at the next power up.

(Example) Transmission control procedure 2, communication speed 19.2 kbps, and station number 28.

➔ WRF03D = HE228 After the setting is completed, WRF03D is changed to H6228. (b15 cleared)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF03D:	a	b	c	0	d				e							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Figure 11.3 Special internal output for setting port 2

Field	Setting value	Content	Note
a	0	Setting completed	After the setting is completed, the system changes this bit to 0.
	1	Setting change request	Set this bit to 1 when changing the setting.
b	0	Transmission control procedure 1	
	1	Transmission control procedure 2	
c	0	Without station number	
	1	With station number	
d	0	Transmission speed	4800 bps
	1		9600 bps
	2		19.2 kbps
	3		38.4 kbps
	Other than above		4800 bps
e	0 ~ 31	Station number *	Set by BCD.

* Communication speed of general purpose port is configured in TRNS/RECV command. Value in WRF03D is ignored.

(2) 1:n station communication on RS-485

When station number mode is used on RS-485, termination command (NAK FF) from host/PC can conflict with reply from CPU, and CPU can fail to receive this command. Pay attention to this possibility at using this command.

(3) Port 2 hardware

The circuit diagram of port 2 and the signal list are shown in Figure 11.4 and Table 11.6 respectively.

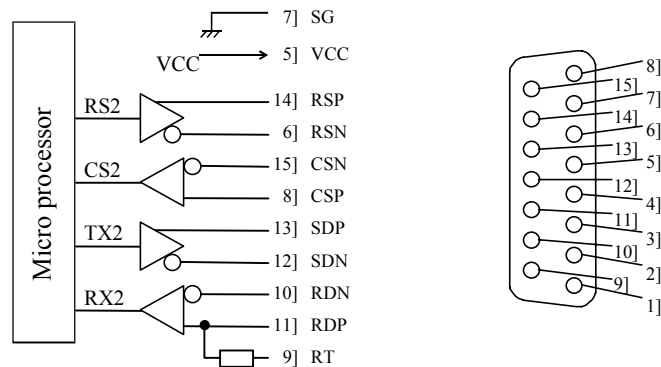

Figure 11.4 Circuit diagram and pin numbers for port 2

Table 11.6 List of port 2 signals

Pin No.	Signal abbreviation	Direction		Meaning
		CPU	Host	
1]	NC			Not used
2]	NC			Not used
3]	NC			Not used
4]	NC			Not used
5]	Vcc	→		5 V DC is supplied.
6]	RSN	→		Transmission request signal. When it is high low, CPU is ready to receive data..
7]	SG	→		Signal ground
8]	CSP	←		Receive enabled signal. When it is high, connected device is ready to receive data.
9]	RT			Terminating resistor (120Ω). Connect to pin 10 if necessary.
10]	RDN	←		Data received by the CPU -
11]	RDP	←		Data received by the CPU +
12]	SDN	→		Data sent by the CPU -
13]	SDP	→		Data sent by the CPU +
14]	RSP	→		Transmission request signal. When it is high level, CPU is ready to receive data.
15]	CSN	←		Receive enabled signal. When it is low, connected device is ready to receive data.

11.4 General purpose port (Port 1,2)

General purpose port can be configured either port 1 or port 2 by FUN 5 command in user program. General purpose port enables serial communication to devices like bar code reader by TRNS/RECV command in user program.

Even if configured, the port works as general purpose port only CPU is in RUN status. Port is changed back to dedicated port when CPU is in STOP status.

* General purpose port is supported by software version 1.30 (WRF051=H0130) or newer.

11.5 Modem Control Function

The 14-point or higher MICRO-EH is equipped with a modem control function. The modem control function can be operated using task codes. To use this function, it is necessary to set No.2 of the DIP SW.

For details on the communication specifications, see Table 11.1, "Specifications of port 1."

* The 10-point type CPU does not have this function.

Connecting two operating modems may be difficult if there is a significant difference between them in terms of communication speeds. Thus, use the models having the same communication speed.

11.5.1 Configuration

Figure 11.5 Modem connection configuration diagram

Table 11.7 List of port 1 signals when a modem is connected

Pin No.	Signal abbreviation	Direction		Meaning
		CPU	Host	
1]	SG1	—	—	Signal ground
2]	CD1	←	—	Carrier receive in-progress notification signal Connected to CD in the modem.
3]	ER1	—	→	Communication enabled signal of the terminal
4]	ER2	—	→	Not used
5]	SD1	—	→	Data sent by the CPU Connected to SD in the modem.
6]	RD1	←	—	Data received by the CPU Connected to RD in the modem.
7]	DR1	←	—	Communication enabled signal of the modem Connected to DR in the modem.
8]	RS1	—	→	Transmission request signal Connected to RS in the modem.

11.5.2 AT Commands

The AT commands are used to make various modem settings, and are set from the host computer. The MICRO-EH issues the AT commands automatically for initial setting. Other than this, the AT commands are not used.

Refer to instruction manual or other documents furnished by modem manufacturers for details on the AT commands.

In AT commands, an instruction sent to the modem from the host is called a "command," and the character string in response to the "command" returned to the host from the modem is called a "result code."

AT commands always begin with the character string "AT," and a return code is input at the end of the command. However, A/ is excluded. The command that follows the "AT" can have multiple inputs in a single line.

Example)

(1) Format

1] AT command format

A	T	command	parameter	command	parameter	...	CR	LF
---	---	---------	-----------	---------	-----------	-----	----	----

2] Result code format

CR	LF	Result code (word)	CR	LF
Result code (number)		CR	LF	

(2) List of commands (extract)

1] AT commands

Command	Function overview	Example
AT	Automatically recognizes data format	—
A/	Re-executes the response directly preceding	—
ATA	Forced reception	
ATDmm	Dial	ATD12345678
ATEn	Command echo (echo back a text string entered to modem) 0: No 1: Yes	ATE0
ATHn	Line ON/OFF 0: On hook (disconnect) 1: Off hook	ATH0 ATH1
ATPn	Pulse (dial) setting 0, 1: 10 pps 2 : 20 pps	ATP0, ATP1 ATP2
ATQn	Result code setting 0: Yes 1: No	ATQ0
ATT	Tone (push) setting	ATT
ATSn = X	Sets S register value.	ATS0 = 0
ATVn	Result code display format 0: Number 1: Word	ATV0 ATV1
AT&Cn	CD signal control 0: Always on 1: Depends on the carrier of counter-party modem	AT&C0 AT&C1
AT&Dn	ER signal control 0: Always on 2: Turning from on to off during communication disconnects line 3: Turning from on to off resets the software	AT&D0 AT&D2 AT&D3
AT&Sn	DR signal 0: Always on 1: Depends on sequence 2: Depends on CD signal	AT&S0 AT&S1 AT&S2
AT&Rn	RI(CI) signal control 0: Turns on from calling start until communication begins 1: Turns on from calling start until communication ends 2: Turns on/off in synchronization with the call signal	AT&R0 AT&R1 AT&R2

2] S register

S register	Set value	Function
S0	0 no automatic reception 1 to 255	Setting for automatic reception/reception ring count
S2	0 to 127 (43 [+])	Escape code setting
S3	0 to 127 (13 [CR])	CR code setting
S4	0 to 127 (10 [LF])	LF code setting

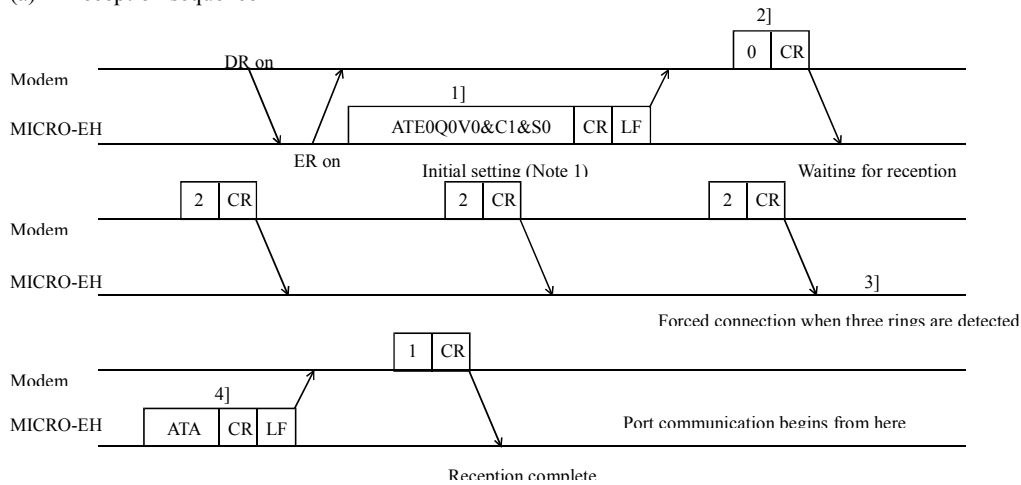

3] Result codes

Number format	Word format	Meaning
0	OK	Normal execution
1	CONNECT	Connection complete
2	RING	Reception detected
3	NO CARRIER	Line disconnected
4	ERROR	Command error
5	CONNECT 1200	1200 bps connection
6	NO DIAL TONE	Cannot hear dial tone
7	BUSY	Busy signal detected
8	NO ANSWER	No tone heard
10	CONNECT 2400	2400 bps connection
11	CONNECT 4800	4800 bps connection
12	CONNECT 9600	9600 bps connection
13	CONNECT 14400	14400 bps connection

(3) Sequence

An example of a communication sequence using the Omron-made modem ME3314A is given below.

(a) Reception sequence

- 1] The PLC issues the AT command that performs the initial setting of the modem.
- 2] If initial setting is OK, the modem returns "0."
- 3] The PLC detects the result code "2" three times while in the reception wait state.
- 4] It connects the modem.

(b) Disconnect sequence

- 1] The PLC disconnects the line when the result code "3" is returned from the modem.

Note 1: Since the modem initial setup sets only minimal items from the MICRO-EH side, connect a personal computer and perform necessary settings before making the connection. (Set the DR signal to always on.) Moreover, do not change the following initial settings.

Contents of the initial settings

Command echo:	None
Result code:	Yes
Display format of result code:	Numerical format

Note 2: The modem timeout (WRF03C) stored in the special internal output refers to the time from data transmission from the MICRO-EH to the data reception from the opposite station (STX, ENQ, NAK). Normally, this special internal output should be set to "0000" (default) or "H8000" (no timeout). Set the timeout only when it is especially necessary to monitor the reception time from the opposite station. When a timeout is detected, the MICRO-EH cuts off the line. When setting the timeout, set the time in the ** part of H80. The unit is * seconds (hexadecimal).

Note 3: Before actually cutting off the line, issue the task code of the line cut off request (HIC--see Appendix 2, "Task code list" for details) from the host side.

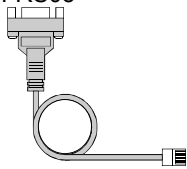

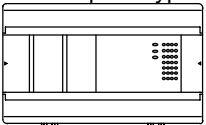

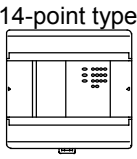

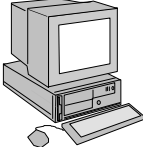

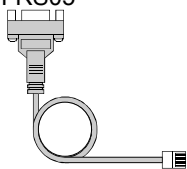

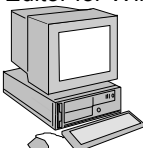

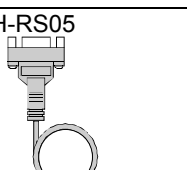

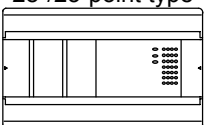

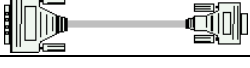

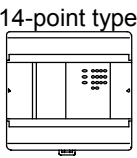

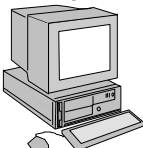

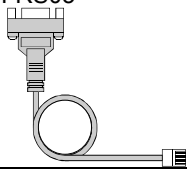

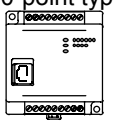

11.6 Connecting to the Ports

The following shows some examples of connections between port 1 and 2 and peripheral units. When creating a connection cable, check it thoroughly in advance according to what the purpose of its use is.

11.6.1 Port 1

Port 1 of the MICRO-EH is a communication port that uses the RS-232C protocol as interface. It is also a dedicated port with which to perform communication by the H series dedicated procedure (high protocol). Table 11.8 lists the types of peripheral units and cables that can be connected to port 1.

Table 11.8 Peripheral unit connection configuration

Peripheral unit	Cable		CPU type
GPCL01H (Ladder Editor, HI-Ladder) 	GPCB02H 	EH-RS05 	28-/23-point type 
			14-point type 
Ladder Editor (DOS version) 	PCCB02H 	EH-RS05 	
Ladder Editor for Windows® 	WPCB02H (PC9800) 	EH-RS05 	28-/23-point type 
	WVCB02H (DOS/V system) 		14-point type 
Pro-H 	EH-VCB02 (DOS/V system) 		
	WVCB02H 	EH-RS05 	10-point type 
	EH-VCB02 		

*1: Set the DIP switches to 19.2 kbps when connecting to a GPCL01H.

*2: Adjust the DIP switch settings to the speed with which to communicate when connecting a LADDER EDITOR or Pro-H. (The speed is fixed at 4800 bps for 10-point type CPU.)

11.6.2 Port 2

Port 2 of the MICRO-EH is a communication port that uses either the RS-422 or RS-485 protocol as interface. It is also a dedicated port with which to perform communication by the H series dedicated procedure (high protocol), which allows 1:n station communication. Figure 11.6 and 11.7 show examples of port 2 connections for 1:n station communication. Moreover, the connection for communicating 1:1 is performed by connecting only the first CPU in the figure below.

(1) In case of RS-422

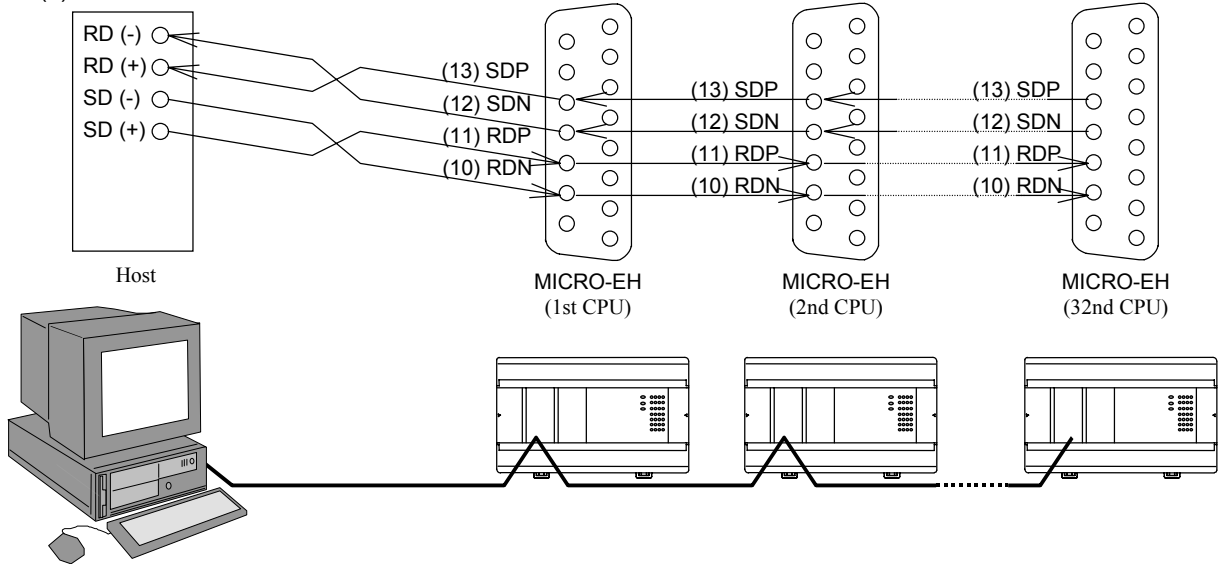

Figure 11.6 Connection for 1:n station communication by RS-422

(2) In case of RS-485

Figure 11.7 Connection for 1:n station communication by RS-485

MEMO

Chapter 12 Error Code List and Special Internal Outputs

12.1 Error Codes

The table below indicates the self-diagnostic error codes. (See Chapter 13, “Troubleshooting” about corrective actions.) Error codes are output as hexadecimal values to the special internal output WRF000. (This special internal output is saved during power failure, and is retained even when the causes of the error are eliminated. Also, when multiple errors occur, the most fatal error in the error classification is stored.)

Note: LED examples The occurrence of a flashing pattern other than the following means a micro computer error.

However, an error code is not reflected in the special internal output in this case.

○ : ON ● : OFF ◐ : Flashing (1 s ON, 1 s OFF) ◑ : Flashing (500 ms ON, 500 ms OFF) ◒ : Flashing (250 ms ON, 250 ms OFF)

Error code	Error name [detection timing]	Classifi- cation	Description	RUN LED	OK LED	Ope- ration	Related special internal output	
							Bit	Word
11	System ROM error [at power ON]	Fatal error	The system ROM has a checksum error or cannot be read (Error in built-in ROM/FLASH)	●	●	Stop	—	—
12	System RAM error [at power ON]	Fatal error	The system RAM cannot be read and/or written properly	●	●	Stop	—	—
13	Micro computer error [always checking]	Fatal error	Address error interrupt, undefined instruction interrupt occurred in the micro computer	●	●	Stop	R7C8	—
—	Reset processing in progress [at power ON]	—	CPU is being reset.	●	●	Stop	—	—
1F	System program error [always checking]	Fatal error	System program in FLASH memory has a checksum error	●	◐	Stop	—	—
23	Undefined instruction [at starting RUN]	Serious error	Error is detected when an attempt is made to execute a user program instruction that cannot be decoded (undefined instruction)	●	◐	Stop	R7C9	—
27	Data memory error [at power ON and initializing CPU]	Serious error	Data memory cannot be read/written properly.	●	◐	Stop	—	—
31	User memory error [at power ON and during RUN]	Serious error	A checksum error is detected in user memory.	●	◐	Stop	R7CA	—
33	User memory size error [at starting RUN]	Serious error	User program capacity set by the parameter is other than 280 HEX.	●	◐	Stop	R7CC	—
34	Grammar/assemble error [at starting RUN and online change in RUN]	Serious error	There is a grammatical error in user program.	●	◐	Stop	R7D4	WRF001
41	I/O configuration error [always checking]	Minor error	<ul style="list-style-type: none"> I/O assignment information and actual loading of module do not match Assignment is made for expansion level 5 or greater. There exists assignment of 5 slots or greater. 	*1	◐	Stop *2	R7CD	WRF002
44	Overload error (normal scan) [at END processing]	Minor error	Execution time for normal scan exceeded the overload check time set by the parameter.	*1	◐	Stop *2	R7D1	—
45	Overload error (periodical scan) [periodical processing]	Minor error	Execution time for periodical scan exceeded the execution period.	*1	◐	Stop *2	R7D2	—
46	Overload error (interrupt scan) [during interrupt processing]	Minor error	An interrupt of the same cause occurred during interrupt scan	*1	◐	Stop *2	R7D3	—

Error code	Error name [detection timing]	Classifi- cation	Description	RUN LED	OK LED	Ope- ration	Related special internal output	
							Bit	Word
5F	Backup memory error [at program downloading and special I/O function setting is requested]	Warning	Data cannot be written to the backup memory.	*1		Run	—	—
61	Port 1 transmission error (parity) [when transmitting]	Warning	Parity error was detected during transmission.	*1		Run	—	—
62	Port 1 transmission error (framing/overrun) [when transmitting]	Warning	Framing error or overrun error was detected during transmission.	*1		Run	—	—
63	Port 1 transmission error (time out) [when transmitting]	Warning	Time out error was detected during transmission.	*1		Run	—	—
64	Port 1 transmission error (protocol error) [when transmitting]	Warning	Protocol (transmission procedure) error was detected during transmission.	*1		Runs	—	—
65	Port 1 transmission error (BCC error) [when transmitting]	Warning	Checksum error was detected during transmission.	*1		Run	—	—
67	Port 2 transmission error (parity) [when transmitting]	Warning	Parity error was detected during transmission.	*1		Run	—	—
68	Port 2 transmission error (framing/overrun) [when transmitting]	Warning	Framing error or overrun error was detected during transmission.	*1		Run	—	—
69	Port 2 transmission error (time out) [when transmitting]	Warning	Time out error was detected during transmission.	*1		Run	—	—
6A	Port 2 transmission error (protocol error) [when transmitting]	Warning	Protocol (transmission procedure) error was detected during transmission.	*1		Run	—	—
6B	Port 2 transmission error (BCC error) [when transmitting]	Warning	Checksum error was detected during transmission.	*1		Run	—	—
71 *3	Battery error (data memory) [always checking]	Warning	<ul style="list-style-type: none"> Battery voltage dropped below the specified value Battery not installed 	*1		Run	R7D9	—
72 *4	Instantaneous power failure detection [always checking]	Warning	Instantaneous power failure detected.	*1		Run	R7CF R7DA	—
94	Port 1 No modem response [when modem is connected]	Warning	There is no response with the AT command.	*1		Run	—	—

- *1: Depends on the CPU's operating state. The RUN LED is lit while the CPU is in operation; the RUN LED is unlit while the CPU is not in operation.
- *2: Depending on the settings of the operating parameters from the peripherals, the operation may be continued even when an error occurs.
- *3: Although batteries cannot be mounted on the 10- or 14-point type, battery errors are monitored by the system. Set R7EE to OFF prior to the use.
- *4: Supported by software version 1.11 (WRF051=H0111) or newer.

How to Clear the CPU Error Code: Set 1 to the Special Internal Output R7EC.
--

12.2 Syntax and Assembler Error Codes

The following describes the syntax and Assembler error codes. The error codes are output as hexadecimal values to the internal output WRF001. The syntax and Assembler error checks are performed at the time of RUN startup.

Error code	Error item	Description of error	Corrective action
H0001	Duplicate definition of LBL	There are 2 or more LBL instructions with the same number in the program	Limit the LBL instruction that has 2 or more of the same number to 1.
H0002	Duplicate definition of FOR	There are 2 or more FOR instructions with the same number in the program	Limit the FOR instruction that has 2 or more of the same number to 1.
H0003	Duplicate definition of NEXT	There are 2 or more NEXT instructions with the same number in the program	Limit the NEXT instruction that has 2 or more of the same number to 1.
H0004	Duplicate definition of SB	There are 2 or more SB instructions with the same number in the program	Limit the SB instruction that has 2 or more of the same number to 1.
H0005	Duplicate definition of INT	There are 2 or more INT instructions with the same number in the program	Limit the INT instruction that has 2 or more of the same number to 1.
H0010	END undefined	There is no END instruction prior to the INT or SB instructions	Define the END instruction before the INT or SB instruction.
H0011	RTS undefined	There is no RTS instruction corresponding to the SB instruction	Define the RTS instruction after the SB instruction.
H0012	RTI undefined	There is no RTI instruction corresponding to the INT instruction	Define the RTI instruction after the INT instruction.
H0013	SB undefined	There is no SB instruction corresponding to the RTS instruction	Define the SB instruction before the RTS instruction.
H0014	INT undefined	There is no INT instruction corresponding to the RTI instruction	Define the INT instruction before the RTI instruction.
H0020	RTS area error	There is the RTS instruction in the normal scan area or interrupt scan program area	Define the RTS instruction within the subroutine area.
H0021	RTI area error	There is the RTI instruction in the normal scan area or subroutine program area	Define the RTI instruction within the interrupt scan area.
H0022	END area error	There is the END instruction in the interrupt scan program area or subroutine program area	Define the END instruction at the end of the normal scan area.
H0023	CEND area error	There is the CEND instruction in the interrupt scan program area or subroutine program area	Define the CEND instruction within the normal scan area.
H0030	RTS start condition error	There is a startup condition in the processing box that includes the RTS instruction	Delete the startup condition of the processing box.
H0031	RTI start condition error	There is a startup condition in the processing box that includes the RTI instruction	Delete the startup condition of the processing box.
H0032	END start condition error	There is a startup condition in the processing box that includes the END instruction	Delete the startup condition of the processing box.

Syntax and Assembler error checks by the task code

The undefined contents of the syntax, Assembler and operation error codes will be checked.

However, error codes will not be set in WRF001

12.3 Operation Error Codes

If an error occurs when a control instruction is executed, “1” is set in the operation error (ERR) special internal output “R7F3” and an error code (hexadecimal) indicating the description of the error is set in WRF015.

To clear the operation errors to zeros, execute “R7F3=0” using a forced setting from a program or peripheral unit. To clear the error codes to zeros, execute “WRF015=0” using a forced setting from a program or peripheral unit.

Error code	Error name	Description of error	Originating instruction
H0013	SB undefined	SBn instruction corresponding to the instruction number n in the CALn instruction is not programmed	CAL
H0015	LBL undefined	LBLn instruction corresponding to the instruction number n in the JMPn and CJMPn instructions is not programmed	JMP CJMP
H0016	FOR undefined	FORn instruction corresponding to the instruction number n in the NEXTn instruction is not programmed	NEXT
H0017	NEXT undefined	NEXTn instruction corresponding to the instruction number n in the FORn instruction is not programmed	FOR
H0040	LBL area error	LBLn instruction corresponding to the instruction number n in the JMPn and CJMPn instructions is not programmed in the same program area	JMP CJMP
H0041	CAL nesting overflow	There are more than 6 levels of subroutine nesting	CAL
H0042	CAL undefined	RTS instruction was executed without executing the CAL instruction	RTS
H0043	FOR to NEXT error	There is a NEXTn with the same instruction number n prior to the FORn instruction	FOR
H0044	NEXT area error	There is no NEXTn instruction with the same instruction number n as the FORn instruction in the same program area	FOR
H0045	FOR to NEXT nesting overflow	The FORn and NEXTn instructions are not nested	FOR
H0046	FOR nesting overflow	There are more than 6 nesting levels of FOR to NEXT	FOR NEXT

12.4 Bit Special Internal Output Area

The MICRO-EH has a special internal output area for performing status display and various other settings. The special internal output area is constantly backed up in case of power failure.

The following lists the definitions of the bit special internal output area (R7C0 to R7FF).

No.	Name	Meaning	Description	Setting condition	Resetting condition
R7C0	Ignore scan time error (normal scan)	0: Stop operation 1: Continue operation	Designates continue/stop running when a normal scan overload error occurs	Set by user	Cleared by user, Cleared when retentive area is cleared, or the CPU is initialized.
R7C1	Ignore scan time error (cyclic scan)	0: Stop operation 1: Continue operation	Designates continue/stop running when a periodic-scan overload error occurs		
R7C2	Ignore scan time error (interrupt scan)	0: Stop operation 1: Continue operation	Designates continue/stop running when an interrupt-scan overload error occurs		
R7C3	Undefined	Do not use.			
R7C4	Undefined	Do not use.			
R7C5	Undefined	Do not use.			
R7C6	Undefined	Do not use.			
R7C7	On line change in RUN	0: On line changed not allowed. 1: On line changed allowed.	Designates whether online change in RUN is allowed in user program	Set by user	Cleared by user, Cleared when retentive area is cleared, or the CPU is initialized.
R7C8	Serious error flag	0: Normal 1: Abnormal	Indicates whether there is an abnormal in the microcomputer (Address error, undefined instruction)	Set by the system	
R7C9	Microcomputer error	0: Normal 1: Abnormal	Indicates whether there is an abnormal in the microcomputer (Computation error)		
R7CA	User memory error	0: Normal 1: Abnormal	Indicates whether there is an abnormal in user memory		
R7CB	Undefined	Do not use.			
R7CC	Memory size over	0: Normal 1: Abnormal	Indicates whether the capacity set by the parameter exceeds loaded memory capacity	Set by the system	Cleared by user, Cleared when retentive area is cleared, or the CPU is initialized.
R7CD	I/O configuration error	0: Normal 1: Unmatched	Indicates whether I/O assignment and loading are matched (Mismatched information output to WRF002)		
R7CE	Undefined	Do not use.			
R7CF *1	Operation mode for instantaneous power failure	0: Hold 1: Reset (same start up operation as normal power on.)		Set by the system	Cleared by user, Cleared when retentive area is cleared, or the CPU is initialized.
R7D0	Undefined	Do not use.			
R7D1	Scan time error (normal scan)	0: Normal 1: Scan time over	Indicates whether the normal scan execution time has exceeded the designated time	Set by the system	Cleared by user, Cleared when retentive area is cleared, or the CPU is initialized.
R7D2	Scan time error (cyclic scan)	0: Normal 1: Scan time over	Indicates whether the periodic scan was completed within cycle time		
R7D3	Scan time error (interrupt scan)	0: Normal 1: Scan time over	Indicates whether an interrupt of the same factor occurred during interrupt scan execution.		
R7D4	Grammar/assemble error	0: Normal 1: Error	Indicates whether there is a grammar error in user program (Detailed information output to WRF001)		
R7D5	Blown fuse detection	0: Normal 1: Error	Indicates whether or not a fuse connected to the second pin (see Chapter 11) of serial port 1 has blown out.	Set by the system	Cleared by the system
R7D6	Undefined	Do not use.			

*1: Supported by software version 1.11 (WRF051=H0111) or newer.

No.	Name	Meaning	Description	Setting condition	Resetting condition
R7D7	Undefined	Do not use.			
R7D8	Undefined	Do not use.			
R7D9	Battery error	0: Normal 1: Abnormal	Indicates whether battery voltage is low	Set by the system	Cleared by the system *2
R7DA*1	Instantaneous power failure detection	0: Not detected 1: Instantaneous power failure detected.		Set by the system	Cleared by user, Cleared when retentive area is cleared, or the CPU is initialized.
R7DB	Self-diagnostic error	0: Normal 1: Error	Indicates whether there is a self-diagnostic error (Detailed information output to WRF000)	Set by the system	
R7DC	Output mode	0: Stops output 1: Continues output	Operation mode at CPU stop for PWM output, pulse output and counter coincidence output.	Set by user	
R7DD	Undefined	Do not use.			
R7DE	Undefined	Do not use.			
R7DF	Undefined	Do not use.			
R7E0	Key switch location (STOP)	0: at RUN position 1: at STOP position		Set by the system	Cleared by the system
R7E1	Undefined	Do not use.			
R7E2	Key switch location (RUN)	0: at STOP position 1: at RUN position		Set by the system	Cleared by the system
R7E3	1 st scan ON after RUN	1: 1 st scan after RUN	ON only at the 1 st scan.		Cannot be cleared.
R7E4	Always ON	1: Always	Always ON regardless of CPU status		Cleared by the system
R7E5	0.02 second clock	0: 0.01 seconds 1: 0.01 seconds			
R7E6	0.1 second clock	0: 0.05 seconds 1: 0.05 seconds			
R7E7	1.0 second clock	0: 0.5 seconds 1: 0.5 seconds			
R7E8	CPU Occupation	0: Unoccupied 1: Occupied	Indicates CPU occupation status from the peripheral unit		
R7E9	RUN prohibited	0: Operation allowed 1: Operation prohibited	Indicates whether it is operation prohibited status		
R7EA	Executing a online change in RUN	1: Being executed	Indicates whether operation is temporarily stopped (output hold) due to online change in RUN		

*1: Supported by software version 1.11 (WRF051=H0111) or newer.

*2: The battery error (R7D9) will turn off when the error cause is eliminated by replacing the battery, etc.

No.	Name	Meaning	Description	Setting condition	Resetting condition
R7EB	Clear retentive area	1: Clear retentive area		Set by user	Cleared by the system
R7EC	Clear error code	1: Clear error code in WRF000 to F00A, R7C8 to 7DE			
R7ED	Undefined	Do not use.			
R7EE	Battery error detection enable/disable	1: Detection enabled 0: Detection disabled	Be sure to set if battery is used.	Set by user	Cleared by user, or when retentive area is cleared, or the CPU is initialized.
R7EF	Backup memory writing execution flag	1: Being written		Set by the system *3	Cleared by the system
R7F0	Carry flag (CY)	0: No carry 1: Carry	Indicates whether there is a carryover from the operation result		
R7F1	Overflow flag (V)	0: No overflow 1: Overflow	Indicates whether there is overflow in the operation result		
R7F2	Shift data (SD)	0: Shift data “0” 1: Shift data “1”	Designates the shift data used in shift instructions, etc.	Set by user	Cleared by user
R7F3	Operation error (ERR)	0: Normal 1: Error	Indicates whether there is an operation error when operation is executed	Set by the system	Cleared by the system
R7F4	Data error (DER)	0: Normal 1: Error	Indicates whether there is a data error when operation is being executed.		
R7F5	Special I/O function setting flag	1: Request to set	For counter, PWM and pulse train	Set by user	
R7F6	Special I/O parameters to write in FLASH *4	1: Request to write	For counter, PWM and pulse train		
R7F7	Special I/O parameter error	0: Normal 1: Error	Indicates the results of the special I/O parameter settings.	Set by the system	
R7F8	Calendar, clock read request	1: Request to read	Read the present values of calendar, clock and set in WRF01B to WRF01F	Set by user	
R7F9	Calendar, clock setting request	1: Request to write	Set the data set in WRF01B to WRF01F in the calendar and clock		
R7FA	Clock ± 30 second adjustment request	1: Request adjustment	When second data (WRF00F) is 0 to 29, it becomes 0 seconds and when it is 30 to 59, +1 minute is added and second data becomes 0		
R7FB	Calendar and clock set data error	0: Normal 1: Error	Indicates whether there is an error in calendar and clock set data	Set by the system	
R7FC	Output control 1	0: Output disabled	Sets the enabling and disabling when Y100 through Y103 is used as PWM output, pulse output, and counter coincidence output.	Set by user	Cleared by user (Cleared by the system in case of pulse output)
R7FD	Output control 2	1: Output enabled			
R7FE	Output control 3				
R7FF	Output control 4				

*3: Cleared by system even when Set by user.

*4: The word special internal output that can be written using this function is shown in Table 12.1 on the following page.

Table 12.1 List of special internal outputs that can be stored

No.	Special internal output that can be stored	Function
1	WRF01A	Dedicated port 1 Communication settings
2	WRF03C	Dedicated port 1 Modem timeout time
3	WRF03D	Dedicated port 2 Communication settings
4	WRF06B	Pulse and PWM auto correction setting
5	WRF06C	Potentiometer 1 Filtering time
6	WRF06D	Potentiometer 2 Filtering time
7	WRF06E	Analog input type selection
8	WRF06F	Phase counting mode
9	WRF070	I/O operation mode
10	WRF071	I/O detailed function settings
11	WRF072	Output frequency On-preset value
12	WRF073	
13	WRF074	
14	WRF075	
15	WRF076	On-duty value Off-preset value
16	WRF077	
17	WRF078	
18	WRF079	
19	WRF07A	Pre-load value Pulse output value
20	WRF07B	
21	WRF07C	
22	WRF07D

24	WRF07F	Input filtering time

12.5 Word Special Internal Output Area

The following lists the definitions of the word special internal output area (WRF000 to WRF1FF).

No.	Name	Storage data	Description	Setting condition	Resetting condition																												
WRF000	Self-diagnosis error code	Error code (Hexadecimal)		Set by the system	Cleared by user																												
WRF001	Syntax/Assembler error details	Syntax/Assembler error code (Hexadecimal)	Error code for user program Syntax/Assembler error is stored																														
WRF002	Further information of I/O configuration error	Mismatched slot number	<table><tr><td>15</td><td>12</td><td>11</td><td>8</td><td>7</td><td>4</td><td>3</td><td>0</td></tr><tr><td>0</td><td colspan="2">a</td><td colspan="2">b</td><td colspan="3">0</td></tr></table> a: Unit number (0 to 5) b: Slot number (0 to F)			15	12	11	8	7	4	3	0	0	a		b		0														
15	12	11	8			7	4	3	0																								
0	a		b		0																												
WRF003-F00A	Undefined	Do not use.																															
WRF00B	Calendar and clock present value (4 digit BCD)	Year	4 digit year [yyyy]	Set by the system	Always displayed																												
WRF00C		Month / date	[mm dd]																														
WRF00D		Day of the week	Sunday: 0000 to Saturday: 0006																														
WRF00E		Hour / minute	[hh mm] (24-hour system)																														
WRF00F		Seconds	[00 ss]																														
WRF010	Scan time (maximum value)	Max. scan time × 10 ms		Set by the system	Cleared by the system (in the RUN starts)																												
WRF011	Scan time (present value)	Current scan time × 10 ms																															
WRF012	Scan time (minimum value)	Min. scan time × 10 ms. (HFFFF at 1 st scan)																															
WRF013	CPU status	<table><tr><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td colspan="2"></td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td colspan="2">Unused</td><td colspan="2">a</td><td>b</td><td>c</td><td>d</td><td>e</td><td>f</td><td>g</td><td>h</td><td colspan="2">i</td></tr></table> a: CPU type (0011), b: Battery error (1=error, 0=no error), c: Not used, d-g: Not used (Fixed to 0), h: Halt (1=executing, 0=not executing), i: CPU operation (1=RUN, 0=STOP)			15	14	13	12	11			8	7	6	5	4	3	2	1	0	Unused		a		b	c	d	e	f	g	h	i

No.	Name	Stored data	Description	Setting condition	Resetting condition
WRF057	Detailed information of counter setting errors	<div> <div>15 14</div> <div>8 7 6 5 4 3 2 1 0</div> <div> <div>a</div> <div>Not used</div> <div>b</div> <div>c</div> <div>d</div> <div>e</div> <div>f</div> <div>g</div> <div>h</div> <div>i</div> </div> </div> <p> a: Error in pulse frequency total b: Pulse 4 frequency c: Pulse 3 frequency d: Pulse 2 frequency e: Pulse 1 frequency f: Counter 4 preset g: Counter 3 preset h: Counter 2 preset i: Counter 1 preset 0=Normal, 1=Error </p>		Set by the system	Cleared by the system
WRF058	PI/O function individual setting request 1 *	<div> <div>15</div> <div>2 1 0</div> <div> <div>Not used</div> <div>a</div> <div>b</div> </div> </div> <p> a: Output number (during pulse setting) Off-preset (during counter setting) b: On-preset (during counter setting) Frequency (during pulse setting), frequency, on-duty (during PWM setting) 0=No changes, 1=Change request </p>		Set by user	Cleared by the system
WRF059	PI/O function individual setting request 2 *	<div> <div>15</div> <div>2 1 0</div> <div> <div>Not used</div> <div>a</div> <div>b</div> </div> </div> <p> a: Output number (during pulse setting) Off-preset (during counter setting) b: On-preset (during counter setting) Frequency (during pulse setting), frequency, on-duty (during PWM setting) 0=No changes, 1=Change request </p>		Set by user	Cleared by the system
WRF05A	PI/O function individual setting request 3 *	<div> <div>15</div> <div>2 1 0</div> <div> <div>Not used</div> <div>a</div> <div>b</div> </div> </div> <p> a: Output number (during pulse setting) Off-preset (during counter setting) b: On-preset (during counter setting) Frequency (during pulse setting), frequency, on-duty (during PWM setting) 0=No changes, 1=Change request </p>		Set by user	Cleared by the system
WRF05B to F06A	PI/O function individual setting request 4 *	<div> <div>15</div> <div>2 1 0</div> <div> <div>Not used</div> <div>a</div> <div>b</div> </div> </div> <p> a: Output number (during pulse setting) Off-preset (during counter setting) b: On-preset (during counter setting) Frequency (during pulse setting), frequency, on-duty (during PWM setting) 0=No changes, 1=Change request </p>		Set by user	Cleared by the system
WRF05D to F06A	Undefined	Do not use.			

No.	Name	Stored data	Description	Setting condition	Resetting condition
WRF06B	Pulse and PWM output auto correction setting	01: For EH-***DTP 02: For EH-***DT 03: For EH-***DRP 04: For EH-***DRT	The output waveforms of the pulses and PWM are automatically corrected by setting the value corresponding to the CPU model.	Set by user	Cleared by user
WRF06C	Potentiometer CH1	Sampling number: 0 to 40.			
WRF06D	Potentiometer CH2				
WRF06E	Analog input type selection	<div><div>1514130</div><div><div>a</div><div>b</div><div>Not used</div></div></div> <p>Selects whether the analog input is voltage or current. a: Analog 1 selection 0=Voltage 1=Current b: Analog 2 selection 0=Voltage 1=Current</p>			
WRF06F	Counting mode of 2-phase counter	00: Mode 0 01: Mode 1 02: Mode 2 03: Mode 3			
WRF070	I/O operation mode	H00: Mode 0 H01: Mode 1 H02: Mode 2 H03: Mode 3 H10: Mode 10			
WRF071	I/O detailed function settings	I/O assignment for counter, PWM and pulse train output			
WRF072 to F075	Output frequency, On-preset value	Frequency setting value, on-preset setting value			
WRF076 to F079	On-duty value, Off-preset value	On-duty setting value, off-preset setting value			
WRF07A to F07D	Pre-load value, Pulse output value	Counter pre-load value or pulse output value			
WRF07E	Input edge	Counter input edge setting value			
WRF07F	Input filtering time	Filter time ×0.5 ms, up to 40 (=20ms)			
WRF080 to F19F	Undefined	Do not use.			

*: See Chapter 8 for more details.

Chapter 13 Troubleshooting

13.1 Error Display and Actions

The display locations of errors detected by individual device in the MICRO-EH system are shown in Figure 13.1. When an error occurs, take an action according to the error code list.

Figure 13.1 Error display locations of the MICRO-EH

(1) Error display

(a) Error display on the main unit

The MICRO-EH will perform self-diagnostic tests using the microcomputer, and when there is an error the contents are indicated in the combination of lit/flashing/not lit of the OK and RUN lamps located in the front of the main unit. See the error code list and action in Chapter 12, for the detailed error codes and actions.

(b) Programmer error display

Error codes encountered during program device operation, such as duplicate definition error, undefined error, operation error, program over, etc., will be displayed on the programming device. For detailed error codes, refer to the error code list in the programming device manual.

(c) GPCL error display

The error detected by the CPU during the GPCL operation is displayed at the bottom left of the screen. For the details of error codes, see the list of error codes in the GPCL manual.

(d) Setting in the special internal output

An error code is set in the special internal output area (such as WRF000). The smaller the error code value, the more serious the error is. When two or more errors occur, the smaller number is set. For example, if "71" (battery error) and "31" (user memory error) occur simultaneously, "31" is set. If the levels are the same, the cause code generated last will be displayed.

The clearing of error special internal output is performed by setting the special internal output R7EC to "1." The R7EC can be set to "1" either by connecting the programming device or by including a subprogram that sets the R7EC using external input within the program. (If turning R7EC on by the program, always set it on after the error cause has been verified. However, if R7EC is turned on by a program that would generate a congestion error, the system may clear the error cause and rerun after detecting a congestion error.)

Note: Error codes are set in hexadecimal values. Verify error codes by setting the monitor to hexadecimal display.

The following shows the range of the special internal output that is cleared when R7EC is set to “1.”

No.	Bit special internal output	No.	Word special internal output
R7C8	Fatal error flag	WRF000	Self-diagnostic error code
9	Microcomputer error	1	Syntax/assembler error details
A	User memory error	2	I/O verify mismatch details
B	(Undefined)		
C	Memory size over		
D	I/O verify mismatch		
E	(Undefined)		
R7CF	(Undefined)		
R7D0	(Undefined)		
1	Congestion error (normal scan)		
2	Congestion error (periodical scan)		
3	Congestion error (interrupt scan)		
4	Syntax/assembler error		
5	(Undefined)		
6	(Undefined)		
7	(Undefined)		
8	(Undefined)		
9	Battery error		
A	(Undefined)		
R7DB	Self-diagnostic error		

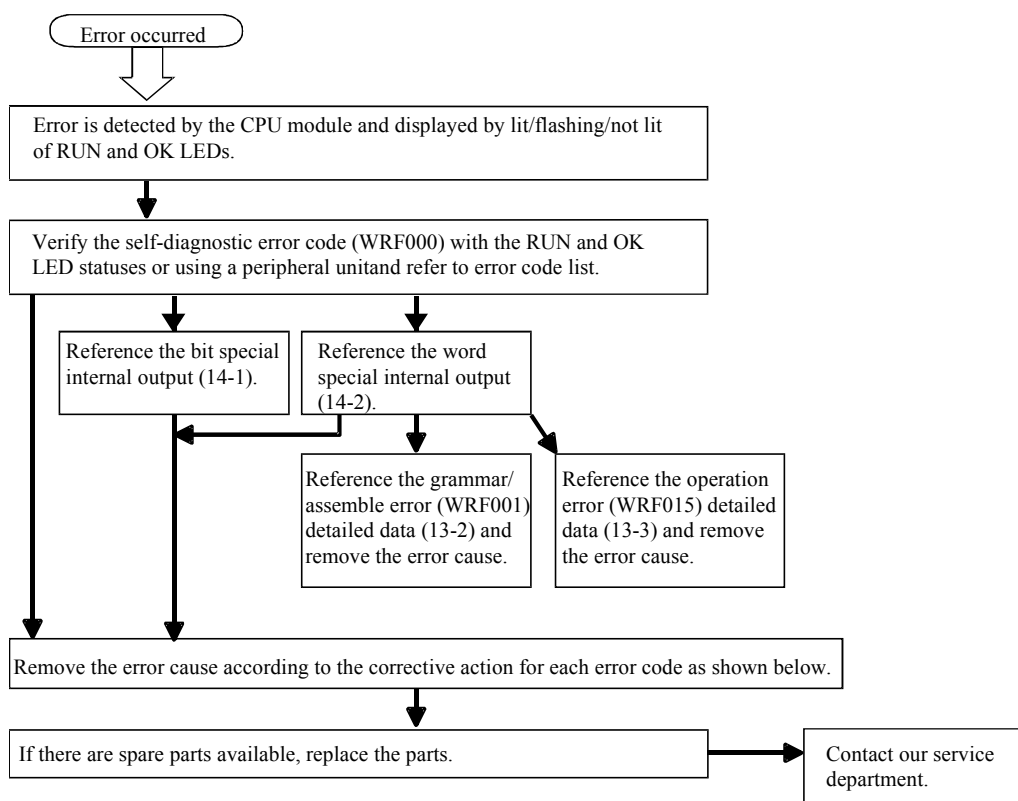

When all of the special internal output data cannot be cleared during program execution, refer to the self-diagnostic error code list and clear only the corresponding error flags by using forced set of the programmer or peripheral unit.

Caution

If the internal output for a self-diagnostic error R7DB (WRF000) is used as a system error for the stop condition of CPU RUN, the R7DB may be turned on even with an error of the warning level (battery error, etc.), causing the CPU to stop. Therefore, do not use the internal output of the self-diagnostic error as a condition for stopping the CPU.

(2) Corrective actions when an error occurred

The process flow when an error occurred is shown below.

Error code	Error name	Corrective action
11	System ROM error	Restart the power.
12	System RAM error	If the same error occurs, it is a hardware error in the CPU module, so replace the CPU module with a spare.
13	Microcomputer error	Make sure that there are no machines, etc. that generate excessive noise near MCRO-EH.
1F	System program error	
23	Undefined instruction	Note: The 1x error cannot be verified since peripheral units cannot be connected until the system starts up after powering on again.
27	Data memory error	
—	Power shut-off, power supply error	Check the power supply voltage of the basic unit and expansion unit.
31	User memory error	The contents of the user program is destroyed. Perform initialization and transfer the program again. This is displayed when the machine is stored with a worn-out battery or without battery for a long period of time.
33	User memory size error	This may be displayed when the contents of the memory within the basic unit is unstable. If the same error occurs after initialization, replace the basic unit with a new one.
34	Syntax/assembler error	There is a syntax/assembler error in the user program. Verify the program and I/O assignment.
41	I/O information verification error	Check the I/O assignment. Check the expansion cable connection.
44	Congestion error (normal scan)	Change the program so that the scan time of the user program is less or change the congestion check time.
45	Congestion error (periodic scan)	Change the program so that the periodic interrupt program execution time is less.
46	Congestion error (interrupt scan)	Perform interlock externally to that the same interrupt will not occur during interrupt processing. Change the program so that the execution time of the interrupt program is short.
5F	Backup memory error	There is a possibility that the FLASH memory cannot be written to. Reset the power after the user program is read and saved to the peripheral units.

Error code	Error name	Corrective action
61	Port 1 transmission error (parity)	Check the connection of the connector cable. Check the settings such as the transmission speed. Check to see if there are any sources of noise near the cable.
62	Port 1 transmission error (framing/overflow)	
63	Port 1 transmission error (timeout)	Check the connection of the connector cable. Check to see if there are any sources of noise near the cable. Verify the protocol specification, examine the host computer processing and correct any errors.
64	Port 1 transmission error (protocol error)	
65	Port 1 transmission error (BCC error)	
67	Port 2 transmission error (parity)	Check the connection of the connector cable. Check the settings such as the transmission speed. Check to see if there are any sources of noise near the cable.
68	Port 2 transmission error (framing/overflow)	
69	Port 2 transmission error (timeout)	Check the connection of the connector cable. Check to see if there are any sources of noise near the cable. Verify the protocol specification, examine the host computer processing and correct any errors.
6A	Port 2 transmission error (protocol error)	
6B	Port 2 transmission error (BCC error)	
71	Battery error	Replace the battery with a new one. Verify the connection of the battery connector.
91	Port 1 Modem no response	Verify the connection with battery. Replace the modem with a new one.

Perform the following procedures to erase the error display.

- (a) When the basic unit is being stopped
Turn the basic unit RUN switch (or RUN terminal) to "STOP," then to "RUN" again.
If the cause of the error has been corrected, the OK lamp is lit. However, the error information remains in the error special internal output, which stores the CPU error types and details. (This makes it possible to analyze the error after recovery.) To reset the error information, perform the procedures shown in (b) or turn ON the special internal output (R7EB) of the power failure memory clear on the peripheral units.
- (b) When the CPU is still running (RUN)
Set the special internal output R7EC to "1" to clear the OK lamp indicator and the error internal output.

13.2 Checklist when Abnormality Occurred

If an error occurs in the MICRO-EH system, check the following items. If there are no problems in the following items, contact our service department.

- (a) Power supply related items
 - Is the power voltage correct? (85 to 264 V AC)
 - Are there any warps in the power supply waveform?
 - Are there any excessive noises in the power supply?
 - Is power supplied for all basic and expansion units?
- (b) CPU related items
 - Are the initial settings (CPU initialization, I/O assignment, parameter settings, etc.) proper?
 - Are there any error codes that are output to the special internal output?
 - Is the RUN switch (or RUN terminal) in the proper location?
 - Are batteries mounted properly? Is the battery life still remaining? (23/28-point types only)
- (c) Input module related items
 - Is the input voltage within the specifications for the internal section?
 - Is there any noise or chattering in the input?
 - Do the I/O assignment numbers in the program match?
 - Is the wiring done properly?
- (d) Output module related items
 - Do the module and the load power supply type (DC/AC) match?
 - Do the load voltage and current match the specification of the output section?
 - Is there any noise or chattering in the output waveform?
 - Is the wiring done properly?
 - Do the I/O assignment numbers in the program match?
 - Are there any unintentional overlaps in the output numbers?
- (e) Wiring related items
 - Is the wiring between the expansions mixed up with other wires?
 - Are the power supply wiring and I/O cables separated?
 - Are there any foreign substances in the connector of the basic/expansion units?

Cautions

- (a) When returning the unit for repair, please notify us of the malfunctioning conditions in as much detail as possible (including error codes, malfunctioning I/O bit number, will not turn on or off, etc.).
- (b) The tools and devices necessary for troubleshooting are briefly as follows:
Phillips/flathead drivers, digital multimeter, tester, oscilloscope (necessary depending on the case) etc.

13.3 Procedures to Solve Abnormality

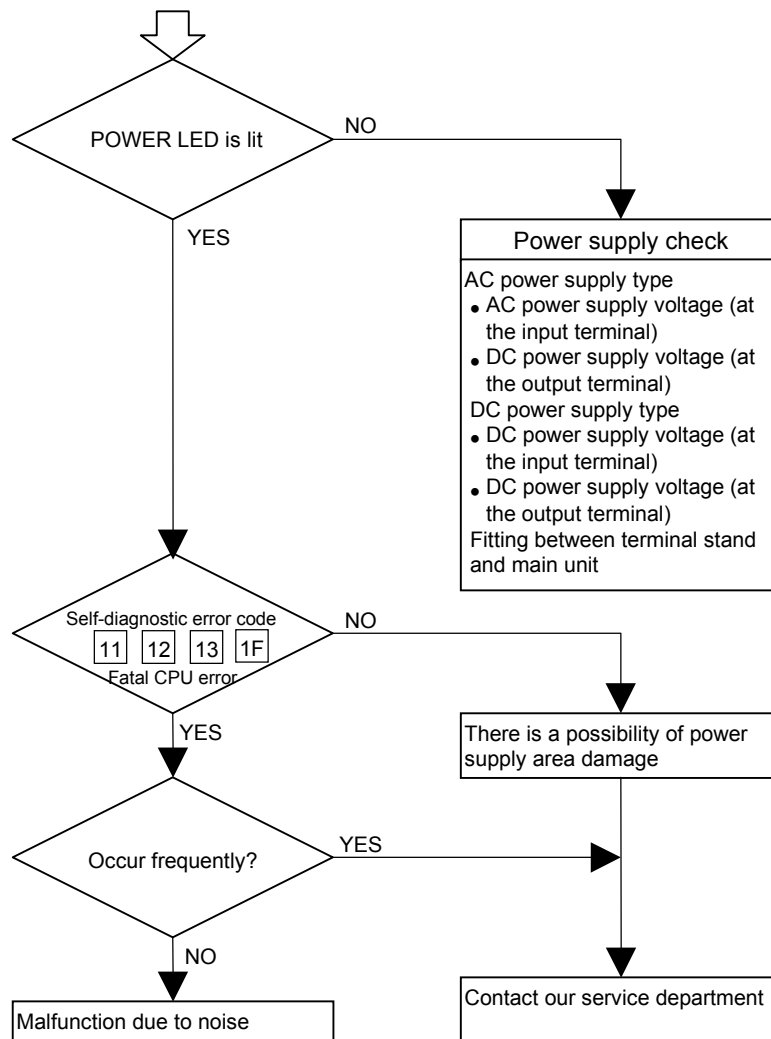

The following shows the processing flow when a problem has occurred:

Major problems	Verification points	Typical causes of problem	Reference item
PLC will not start	Power LED, CPU error code	Power supply problem, power shut-off, insufficient power supply capacity, fatal CPU error	(a)
Will not operate (will not RUN)	CPU error code, CPU LED, Internal output of error	I/O assignment problem, incorrect parameter settings, incorrect user program, syntax error, operating conditions not established, write-occupied status	(b)
Operation stopped (RUN stopped)	Power LED, CPU LED, CPU error code	Power supply problem, expansion power supply problem/shut-off, CPU problem, memory problem	(c)
Erroneous input, no input (abnormal operation)	CPU LED, I/O LED Monitoring by peripheral units	User program timings, input power supply, bad connection, problem in input area, I/O inductive noise	(d)
Counter input does not operate	Input LED, special internal output setting	Input power supply, bad connection, problem in input area, I/O inductive noise, operating mode setting error	(e)
Output error, no output (abnormal operation)	CPU LED, I/O LED, Monitoring by peripheral units, Forced setting	User programming, bad connection, problem in output area, I/O inductive noise	(f)
PWM pulse output does not operate	Output LED, special internal output setting	Bad connection, problem in output area, I/O inductive noise, operating mode setting error	(g)
Peripheral unit problem	CPU error code, fuse, peripheral units	Fatal CPU error, peripheral unit problem, peripheral unit setting error, cable problem, broken fuse	(h)

- (a) PLC will not start
 [The CPU OK LED does not turn off even when power is started, nor peripheral units cannot be connected on-line.]

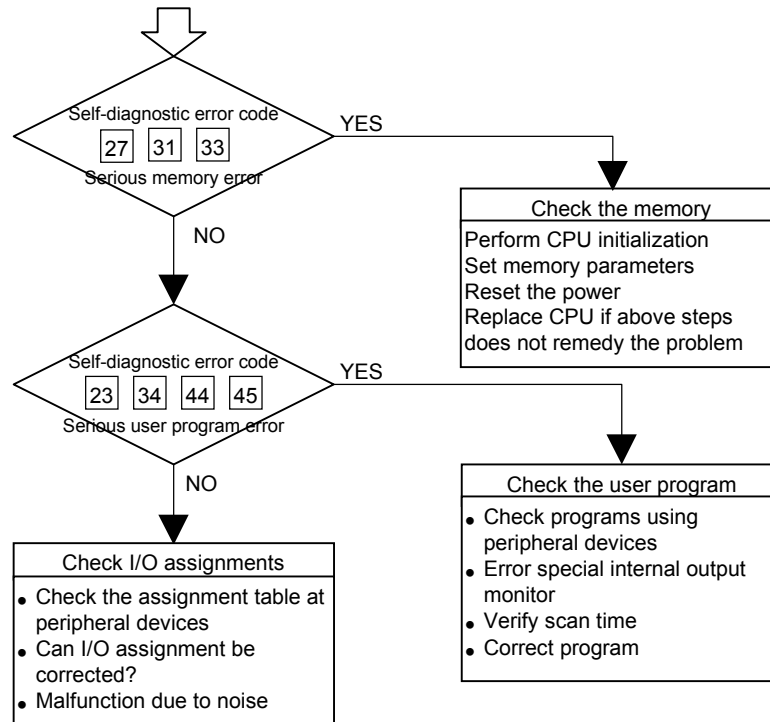

(b) Will not operate (will not run)

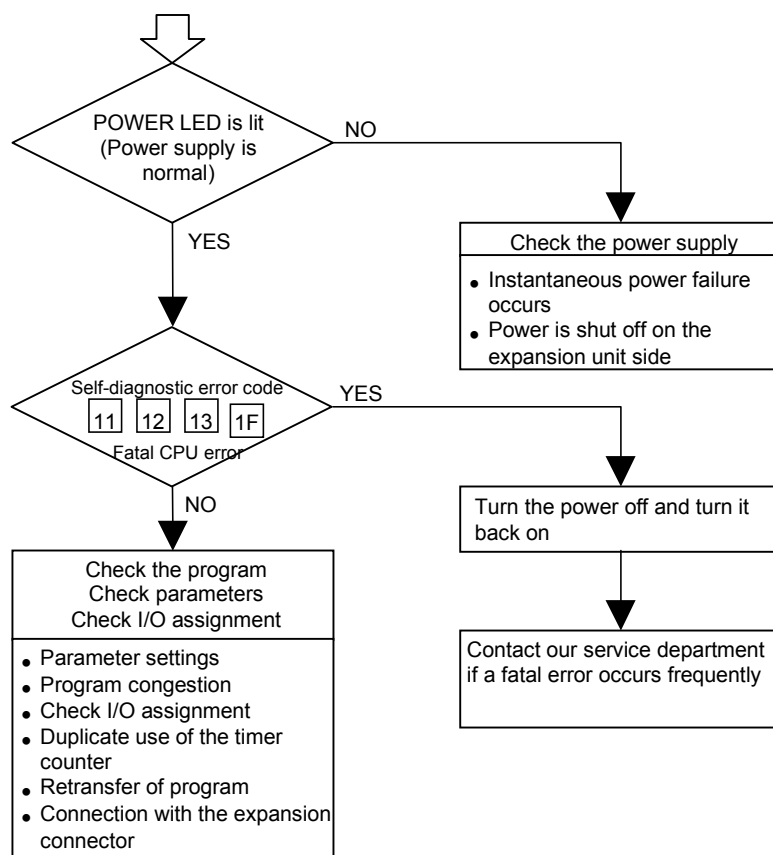

Even if the PLC operation conditions are met, the CPU does not operate (the RUN LED does not turn on) and remains stopped. However, the peripheral units go on-line.

Caution

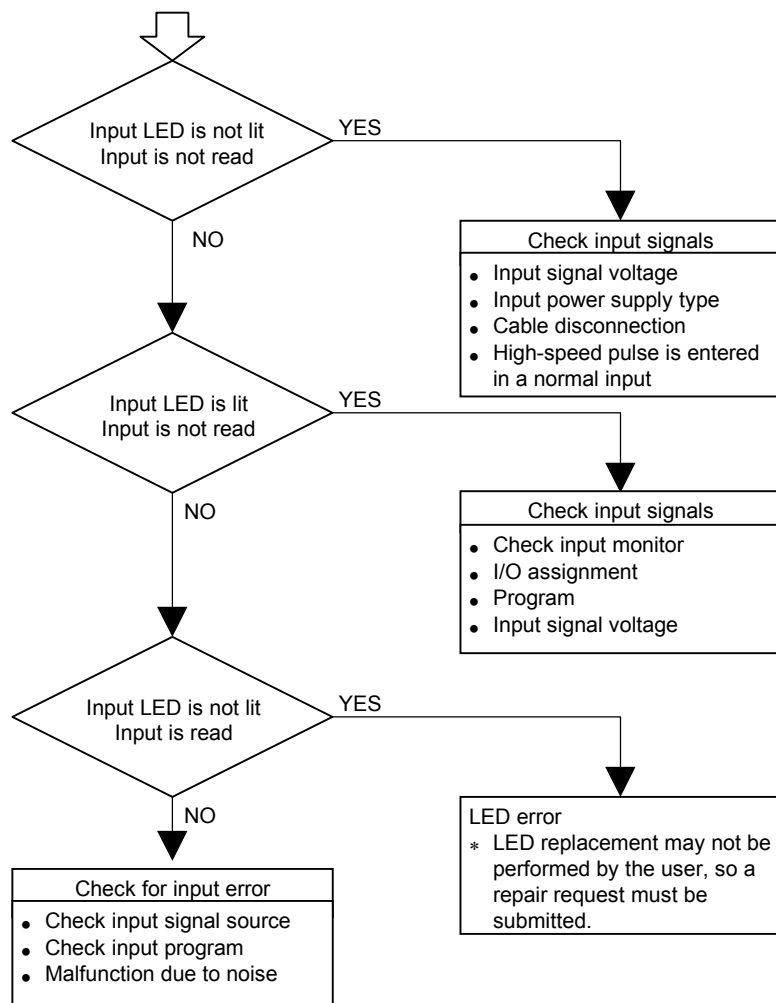

If the CPU is WRITE-occupied, the CPU will not run even if the RUN switch is switched from “STOP” to “RUN.” The CPU starts running by pressing the GRS key after peripheral units are connected.

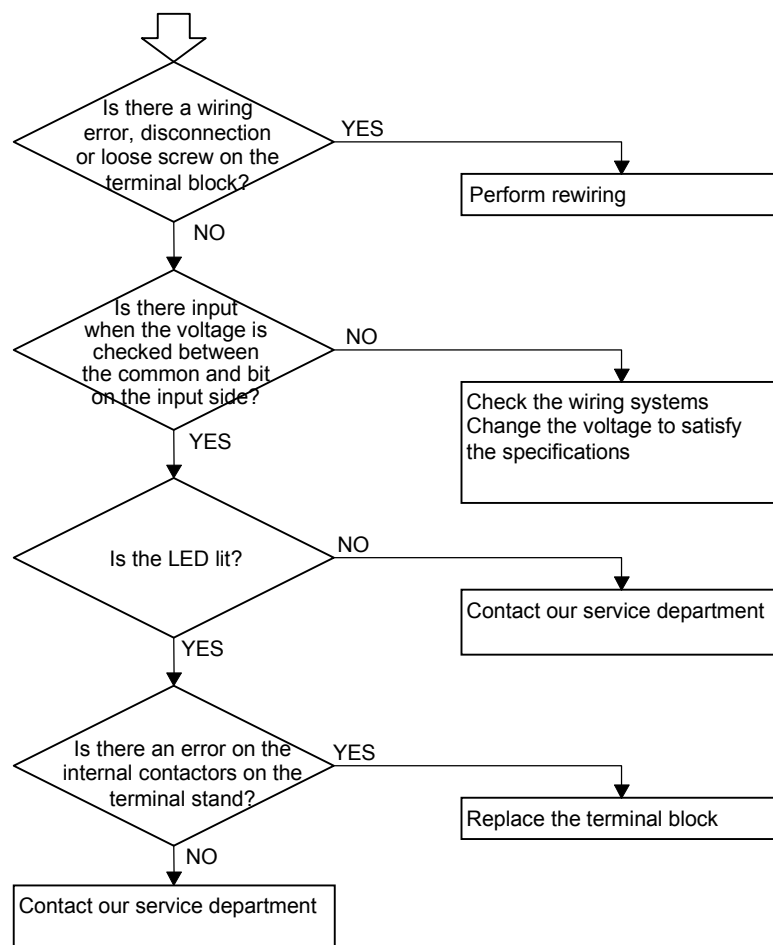

- (c) Operation stopped (RUN stopped)
 [During normal operation, the CPU suddenly stops (the RUN LED turns off).]

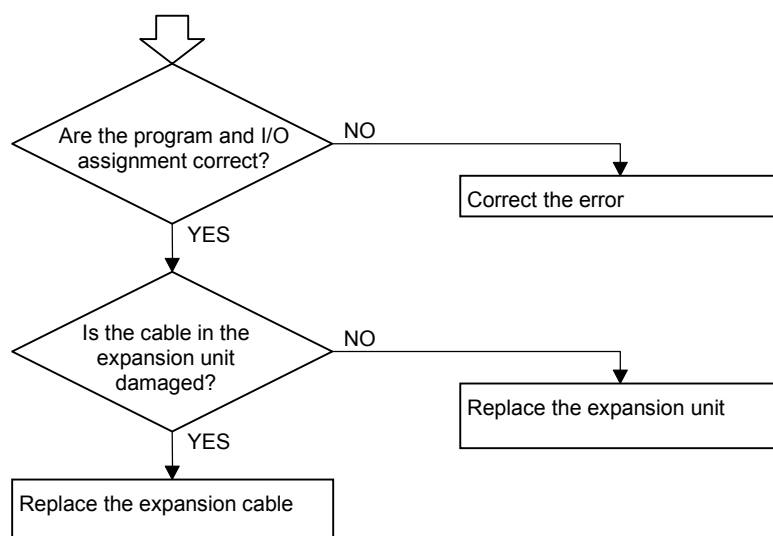

- (d) Wrong input at input module or no input (operation problem)
 { The CPU runs, but the input data is not correct. }

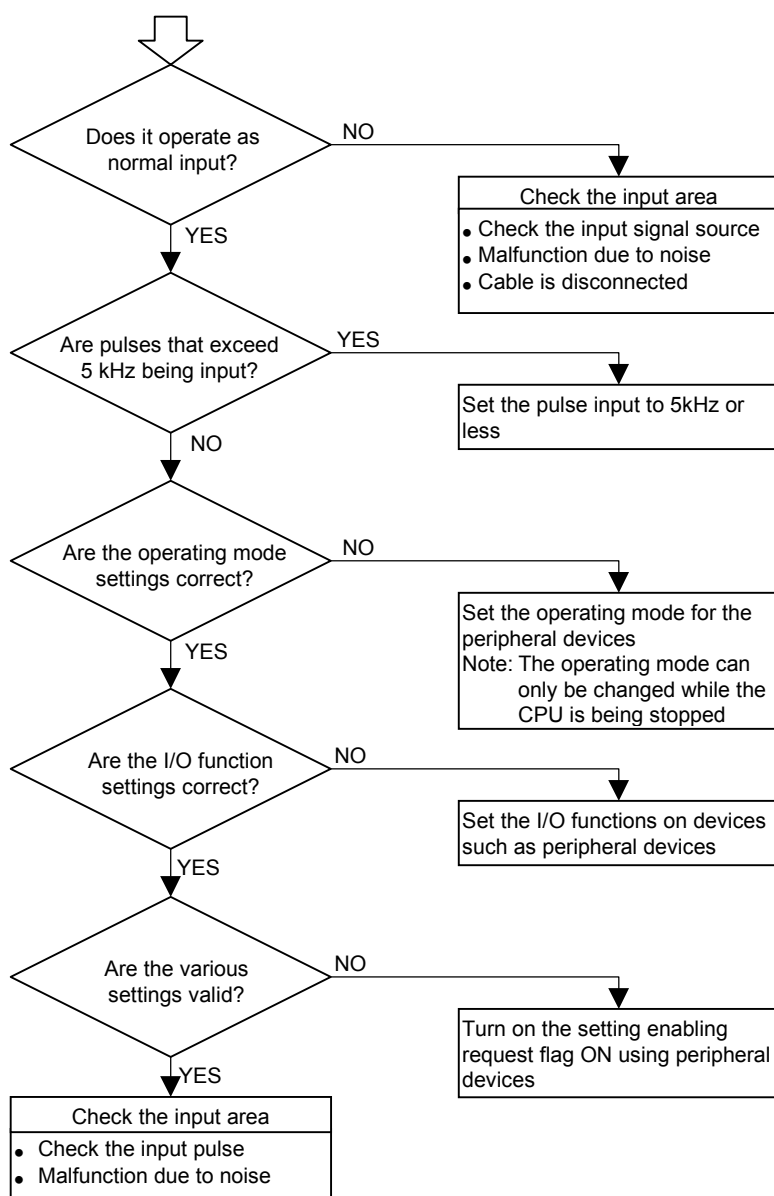

[Data cannot be entered.]

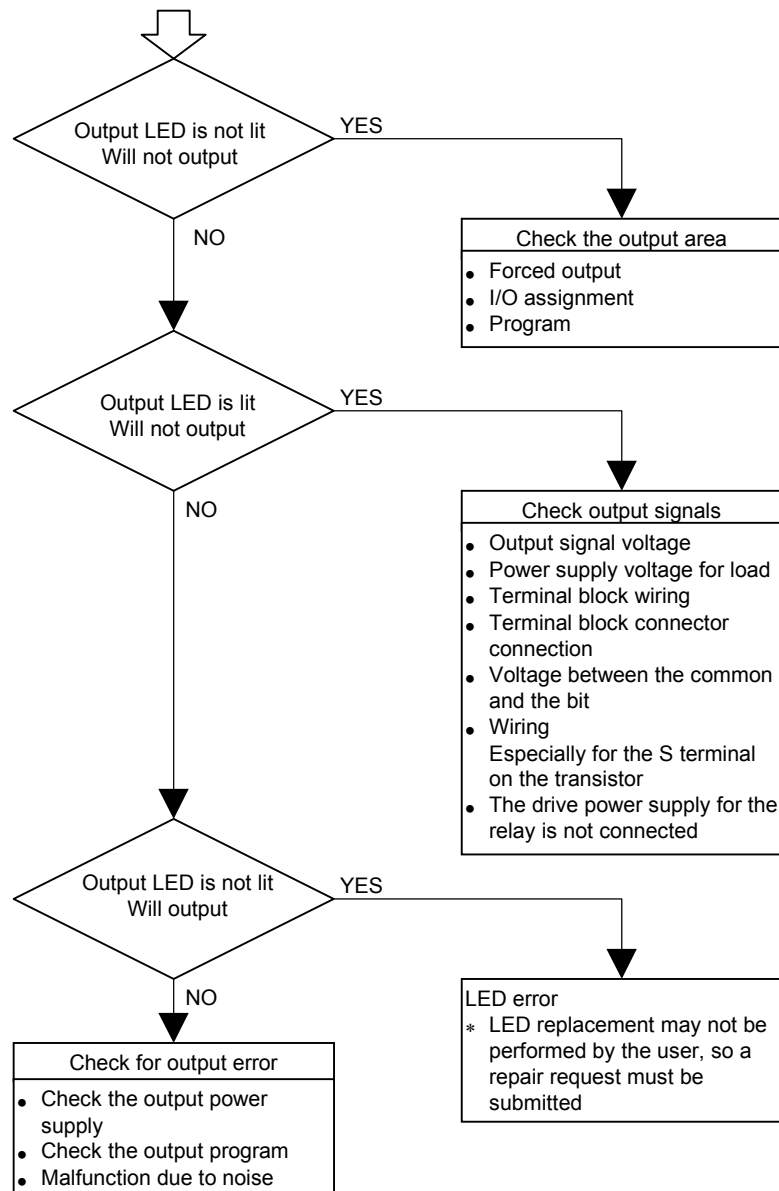

[I/O assignment error is generated, but data is read.]

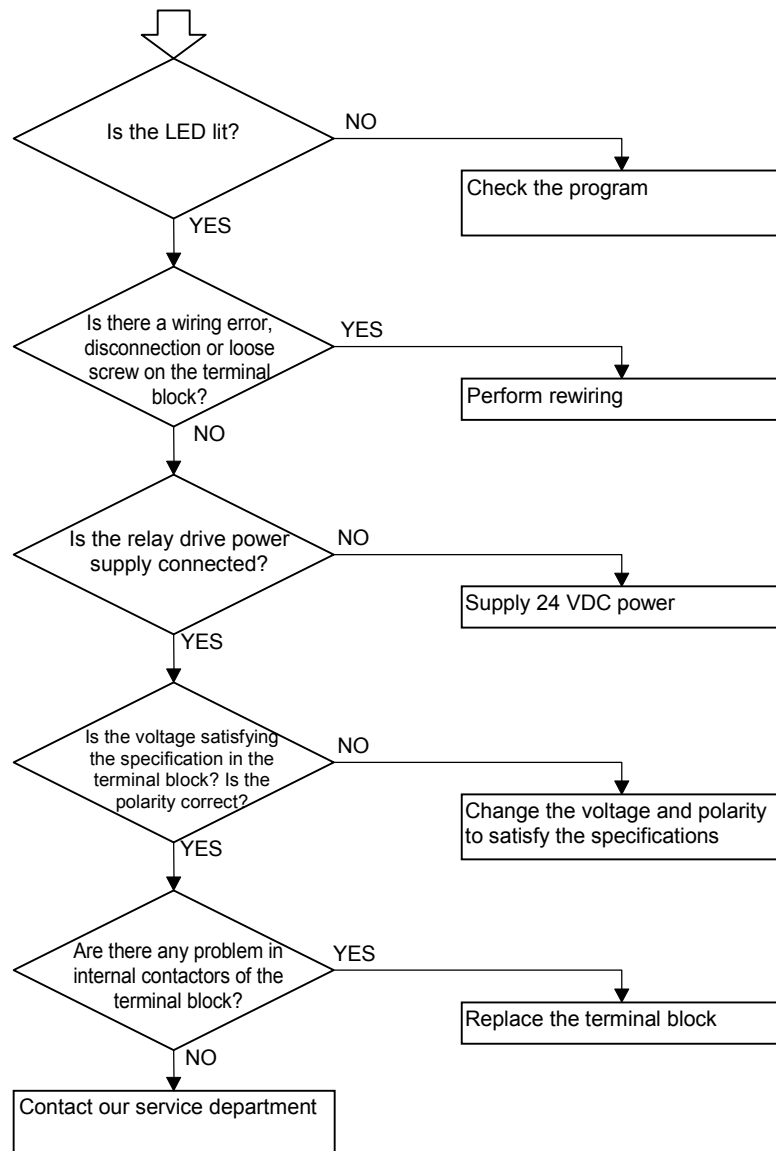

- (e) The counter input does not function
 { The CPU operates, but the input data is incorrect }

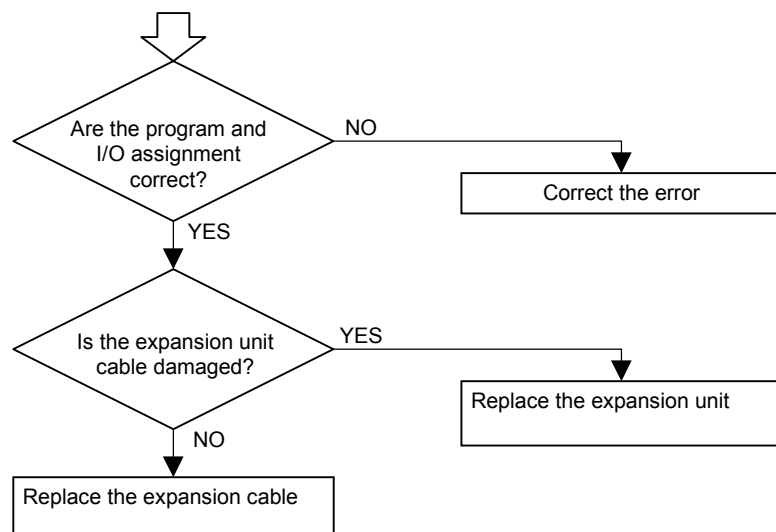

- (f) Wrong output from output module or output module will not output (operation problem)
 { The CPU operates, but output signals are not correct. }

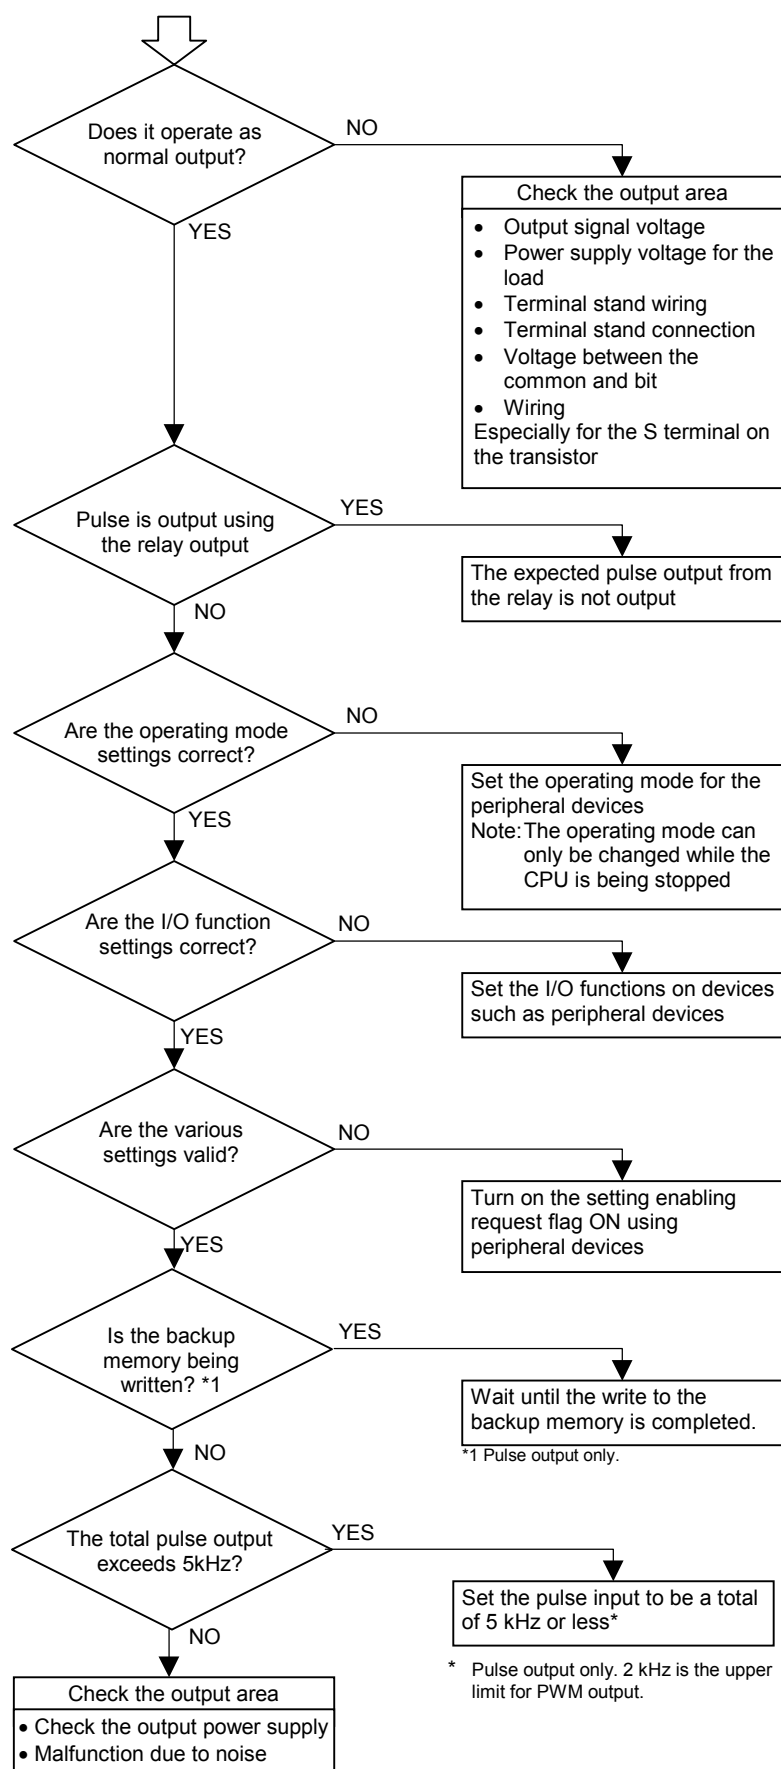

[The CPU operates, but output signals are not detected.]

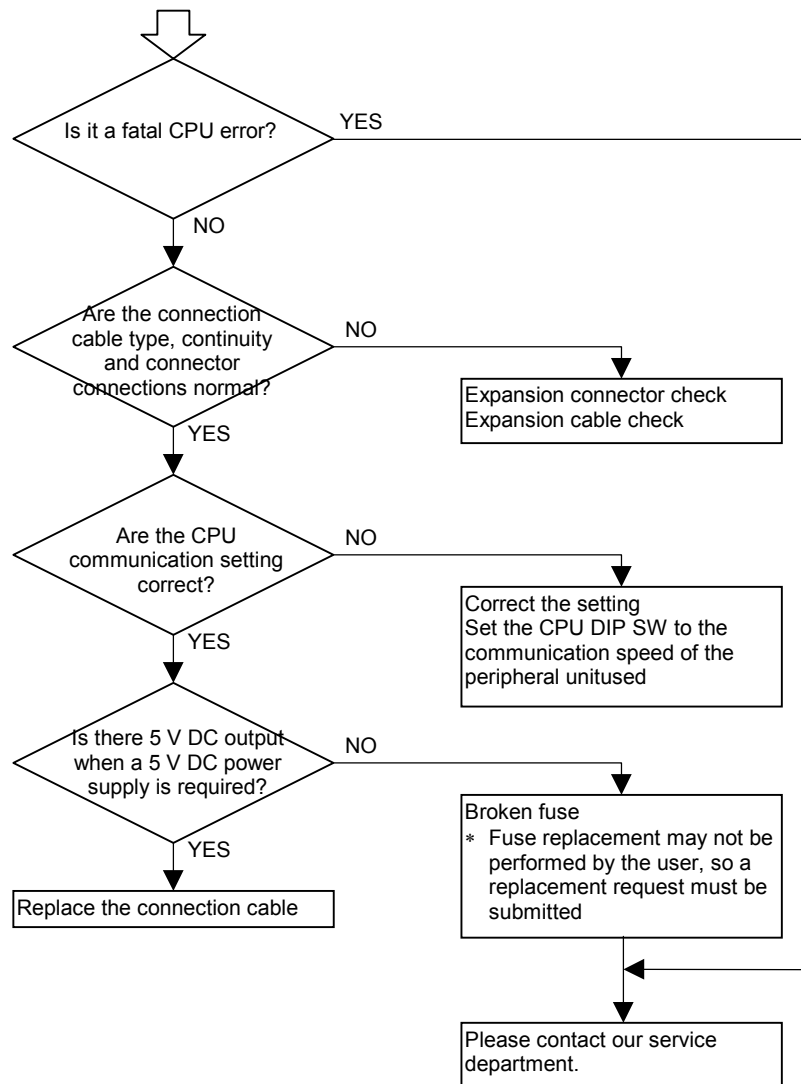

[I/O assignment error occurred, but output is normal.]

- (g) { The PWM and pulse output does not operate
The CPU operates, but the pulse output and PWM output are not correct }

- (h) { Peripheral units problem
Peripheral units cannot be connected. }

Chapter 14 Operation Examples

To understand the basic operation of the MICRO-EH, this chapter explains samples of operations such as inputting simple programs and verifying operations.

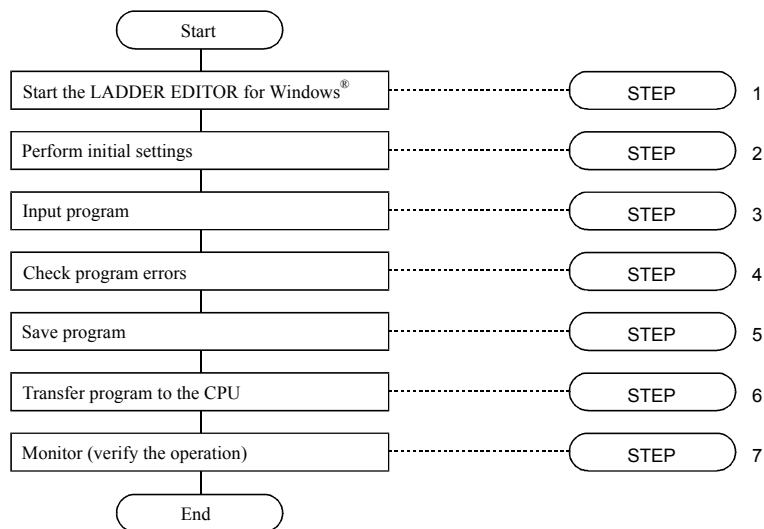

The following programming devices can be used:

	Peripheral unit name	Form
1	H series ladder diagram instruction language software LADDER EDITOR	HL-PC3 HL-AT3E
2	H series ladder diagram instruction language software LADDER EDITOR for Windows® version	HLW-PC3 HLW-PC3E

* Graphic input device (format: GPCL01H) can be used except on-direct mode.

(1) Operation verification procedures

An operation is verified according to the following procedures:

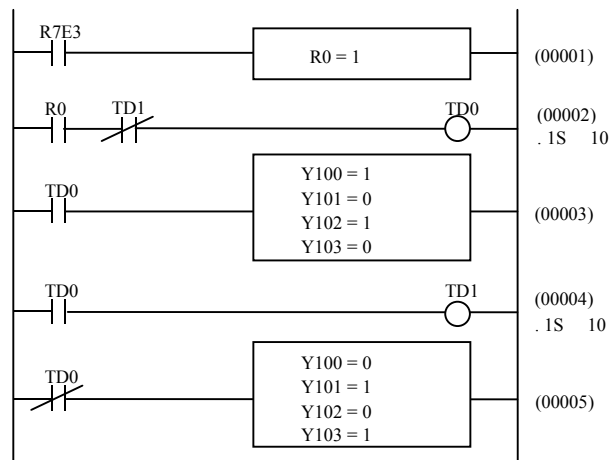

A personal computer and LADDER EDITOR for Windows® are used as the peripheral units in the example. For details, refer to the user's manual for each peripheral unit.

(2) Detailed operation example

The following explains an operation example using the module and sample program from step 1.

CPU: 14-point type
 Slot 0: Bit point X48
 Slot 1: Bit point Y32
 Slot 2: 16 vacant points
 Input/output operating mode: Mode 0
 (WRF070 = 0, default value)

Operation of program
 Turn Y100 and Y102 on and Y101 and Y103 off and vice versa, alternating at one second intervals.

STEP 1 Starting the LADDER EDITOR for Windows®

1. Start the personal computer.

Start the personal computer.

2. Start the LADDER EDITOR for Windows® system (GRS screen).

From the Start menu of Windows®, click
[Program] → [Hladder] → [Hladder].
 As LADDER EDITOR for Windows® is started,
 the GRS screen is displayed.

3. Switching to Offline mode.

Click **[Offline]** in the Menu bar.

The Read/Edit screen is displayed.

STEP 2 Initialization

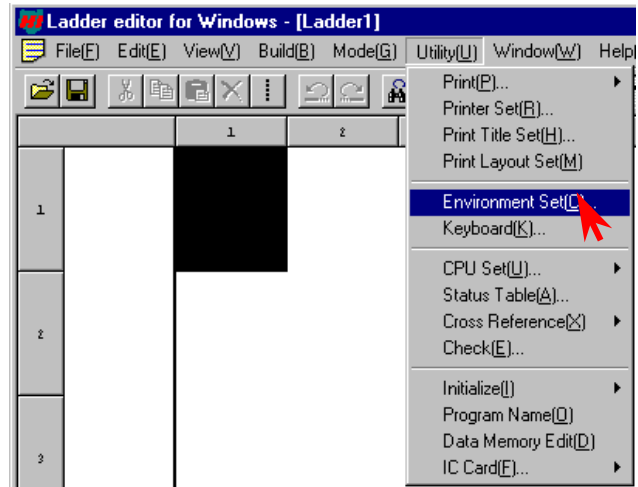

Settings for the CPU type, memory type and I/O assignment are performed.

1. Setting the CPU type

Click **[Utility]** → **[Environment Settings]** in the Menu bar.

Pull-down menu

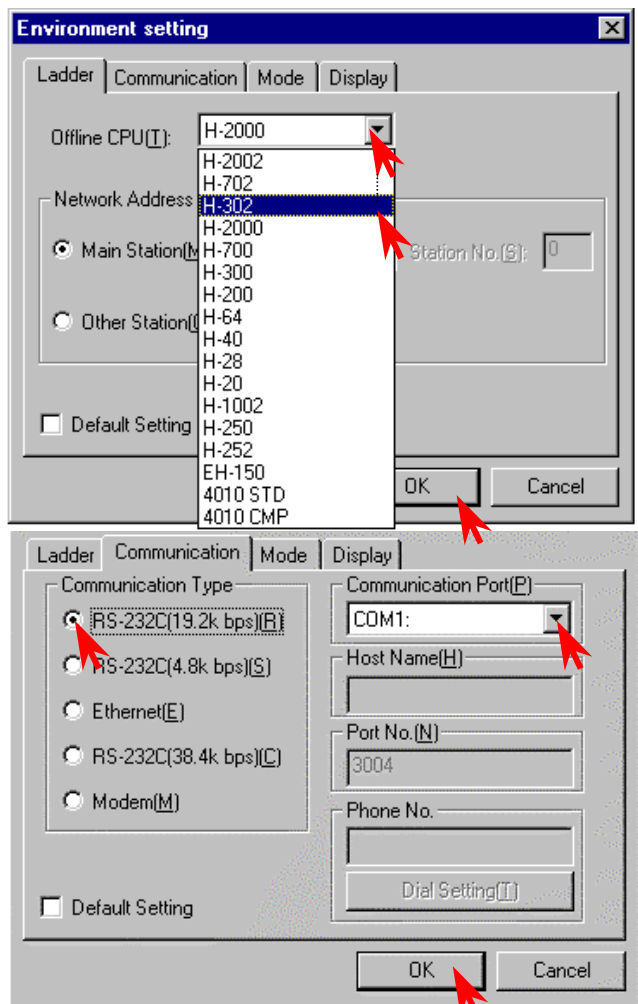

The Environment Setting dialogue box is displayed.

Specify the CPU type from the Ladder tag.

- Click the ▼ of the Offline CPU field to show the available CPU types in the pull-down display. Select the CPU type.
- Click the **[OK]** button.

Pull-down display of CPU types

Specify the transmission speed from the Communication tag.

- Select the transmission speed set with the DIP switches of the MICRO-EH main unit (in case of the 10-point type CPU, the transmission speed is fixed at 4800 bps).
- Specify the communication port.
- Click the **[OK]** button.

Pull-down display of CPU types

Select "H-302" for the CPU type setting.

2. Setting the memory type

Click **[Utility]** → **[CPU Setting]** → **[CPU Information]** in the Menu bar.
The CPU Information dialogue box is displayed.

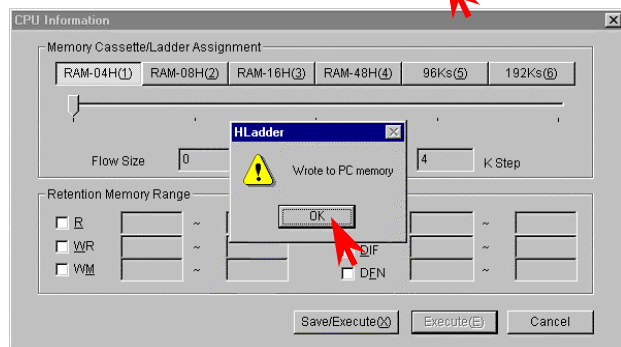

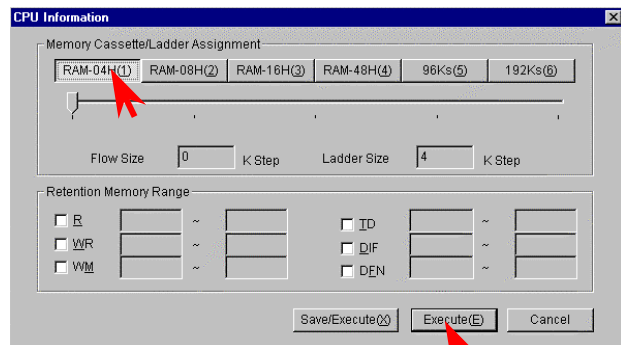

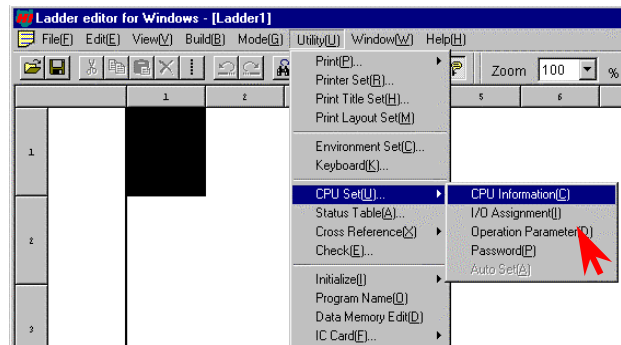

- Click the Memory Cassette/Ladder Assign button and select the memory cassette size.
- Click **[Execute]** or the **[Memory/Execute]** button.

- Click the **[OK]** button in the confirmation dialogue box.

Set the memory cassette size to RAM-04H.
[Execute]: Save to the PC memory
[Memory/Execute]: Save to the PC memory and Window registry.

3. Assigning I/O

Click **[Utility]** → **[CPU Setting]** → **[I/O Assign]** in the Menu bar.

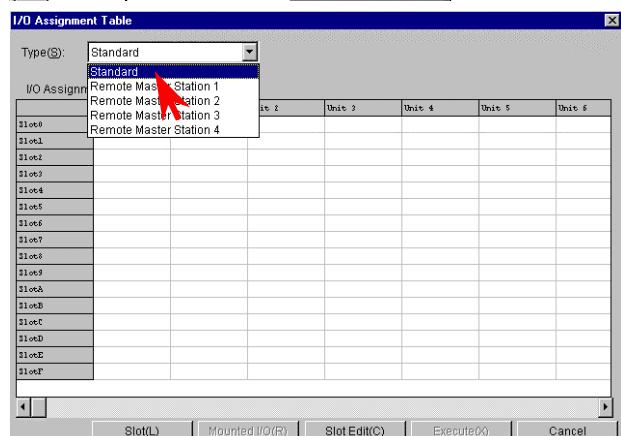

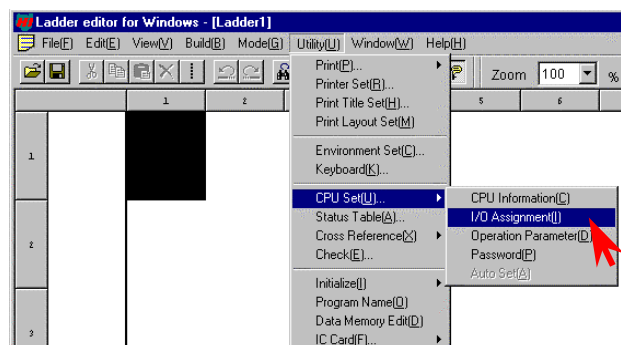

The I/O Assign List dialogue box is displayed.
Click the ▼ of the Types field and select **[Standard]** from the pull-down display.

There are two setting methods for the subsequent procedures.

- From the I/O Assign List
- From the I/O Assign List → Slot Setting Status

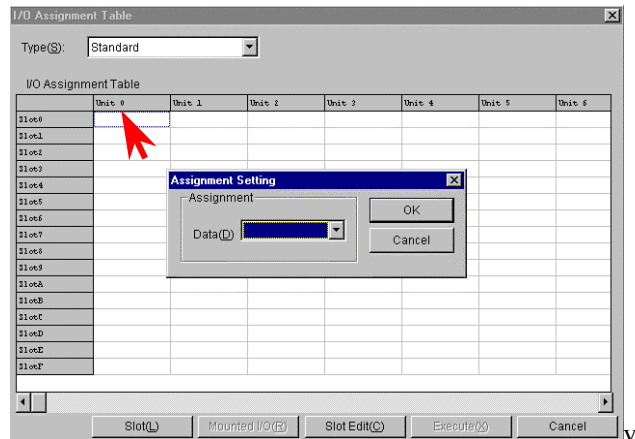

[Setting from the I/O Assign List]

- 1] Double-click the cell for the unit number and slot number to be set.

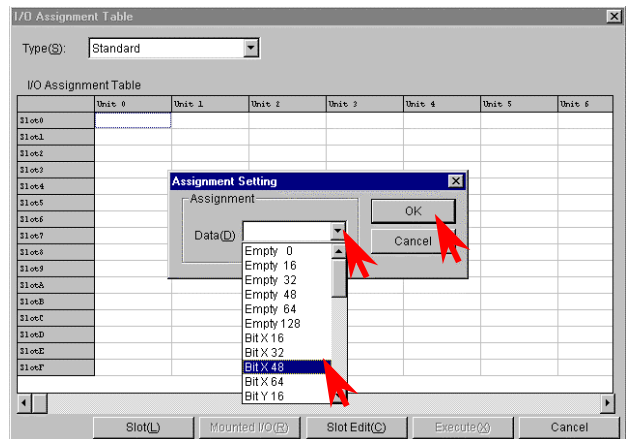

The Assignment Setting dialogue box is displayed.

The Assignment Setting dialogue box

- 2] Click the ▼ of the data and select I/O type from the pull-down display.
- 3] Click the **[OK]** button to close the Assignment Setting dialogue box.

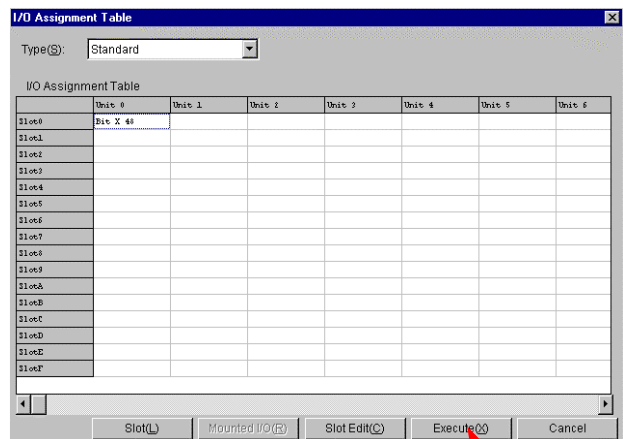

Setting of I/O type

In the same way, repeat steps 1] to 3] to assign X48 and 16 vacant points to Slot 1 and 2 respectively.

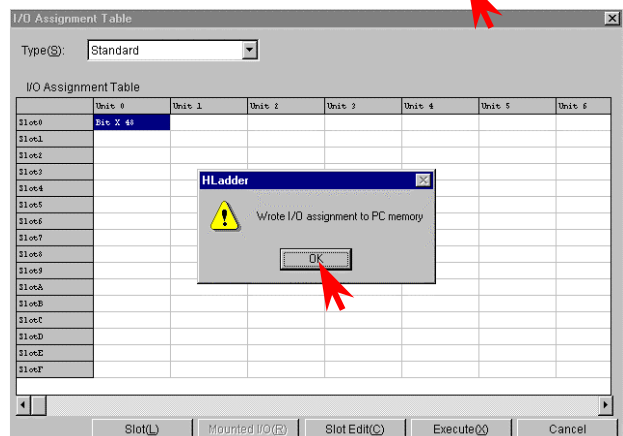

If a wrong value has been entered, the slot is left blank by assigning [Vacant 0] and is treated as though nothing is assigned to it.

- 4] Click the **[Execute]** button.
The information assigned to the PC memory is written.

- 5] Click the **[OK]** button in the confirmation dialogue box to close the I/O Assignment List dialogue box.

Confirmation dialogue box

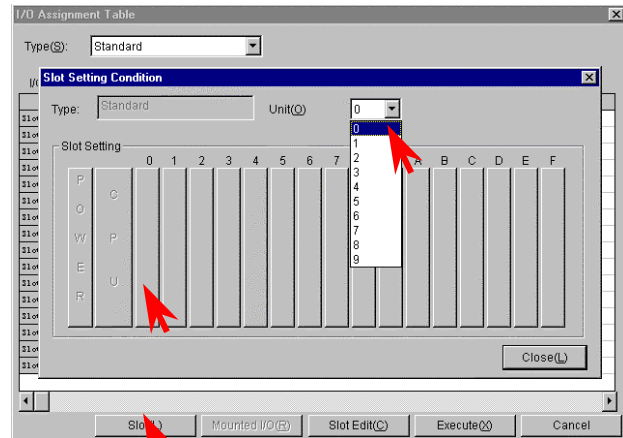

[Setting from the Slot Setting Status]

Click the **[Slot]** button to display the Slot Setting Status dialogue box.

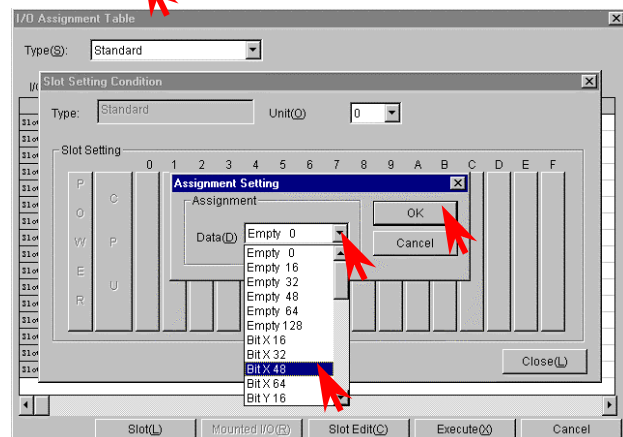

- 1] Click the ▼ of the unit and select the unit number from the pull-down display.
- 2] Click the button of the slot number to be set.

Slot Setting Status dialogue box

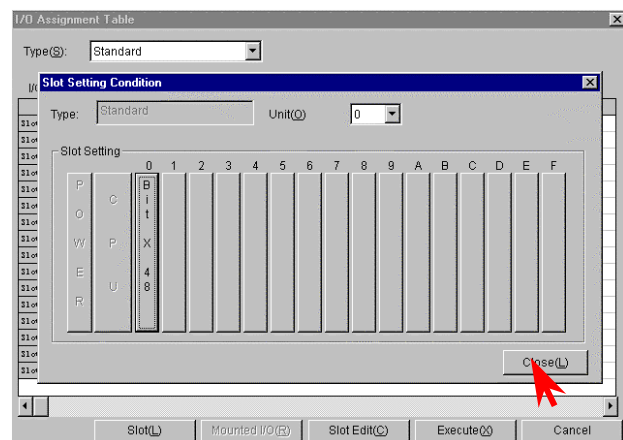

- 3] Click the ▼ of the data and select the I/O type from the pull-down display.
- 4] Click the **[OK]** button and close the Assignment Setting dialogue box.

Specification of I/O type

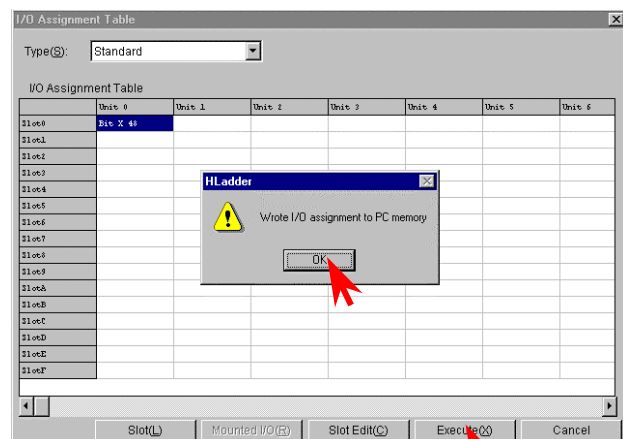

In the same way, repeat the steps 1] and 2] to 4] to set other unit and slot numbers in order to perform I/O assignment according to the unit to be used. In this example, X48 and 16 vacant points are assigned to slots 1 and 2 respectively.

- 5] Click the **[Close]** button to close the Slot Setting Status dialogue box. Enter the I/O assignment set in the Slot Setting Status into the I/O Assignment List.

- 6] Click the **[Execute]** button to write the assigned information to the PC memory.
- 7] Click the **[OK]** button in the confirmation dialogue box to close the I/O Assignment List dialogue box.

Confirmation dialogue box

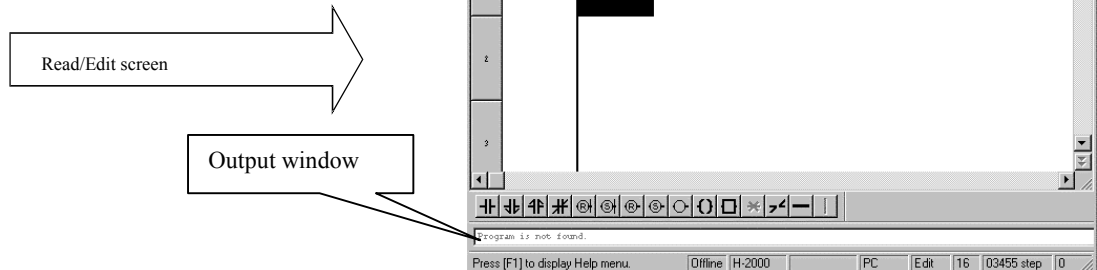

For online mode, it is possible to read the I/O mounted on the CPU by the "Mount" button. For details, refer to the "Reading Mounted I/O" of the programming device.

STEP 3 Program Input

1. Input a program.

At first, the output window displays “there is no program” in the bottom left of the Read/Edit screen.

The cursor ■, which indicates the program input position, is placed at the top left of the screen.

[Input procedure of ladder program]

Repeat steps 1) to 4) to proceed with symbol input. The usual operations found in other Windows applications, such as cut, copy, paste, and move, can be performed on already input symbols.

- 1) Specify the input position. (Move the cursor ■ by clicking the mouse or the arrow keys.)
- 2) Click symbols in the Symbol bar.

- 3) Input the desired function (I/O, comparison expression, arithmetic expression) in the dialogue box for the symbol displayed.
- 4) Click the **[OK]** button in the dialogue box.

[Example of entering a contact]

- 1) Begin from the cursor position at the top left.
- 2) Click the symbol for contact A.

The dialogue box for contacts is displayed.

- 3) Enter “R7E3” as the I/O No. in the Input field. (I/O No. (half-width alpha-numeric input) can be entered by the keyboard only, or by selecting the initial letter(s) from the pull-down menu of ▼ and by typing the rest.) Enter a proper comment.

- 4) Click the **[OK]** button.
- The dialogue closes.

When the dialogue box closes, the symbol is displayed in the Read/Edit screen and the cursor shifts.

The comment is displayed under the symbol.

[Example of entering a Processing Box]

- 1] The specification of the input position can be omitted when entering symbols into the same circuit as the contact above.
- 2] Click the symbol for Processing Box.

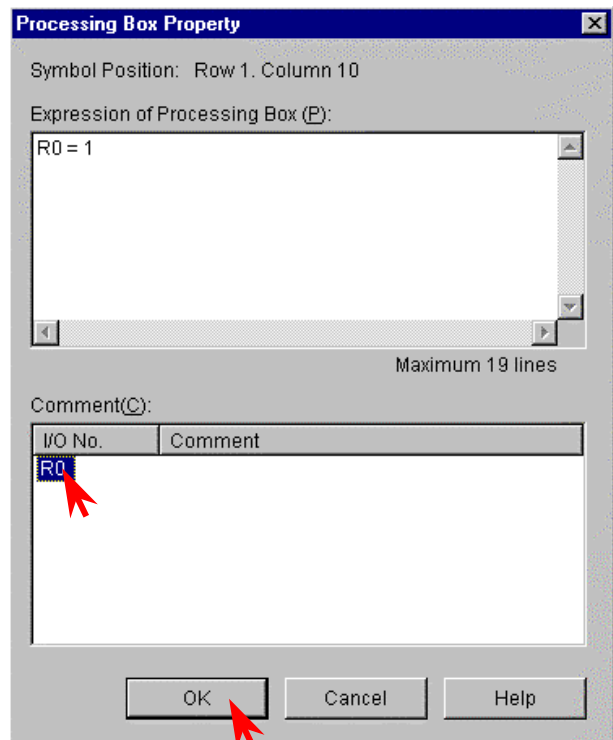

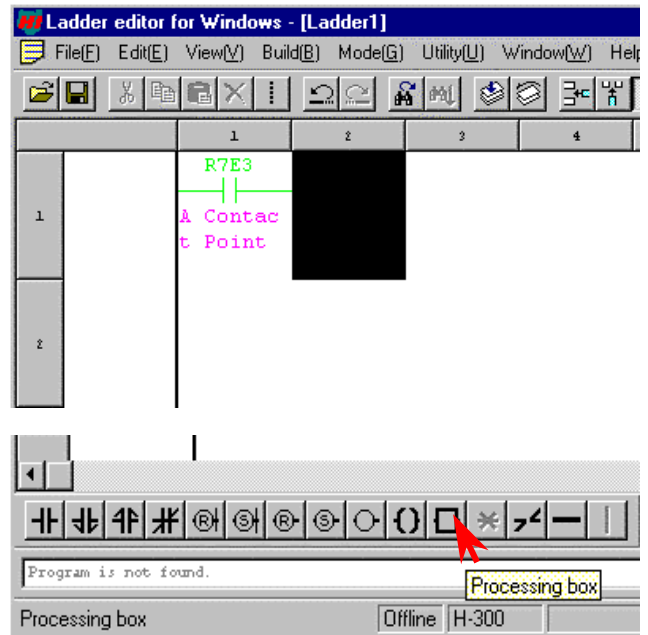

The cursor moves to the far-right portion of the screen automatically.
The dialogue box for the processing box symbol is displayed.

- 3] Input arithmetic expressions in the Expression in Processing Box text field.
Multiple lines (a maximum of 19) can be input by including line breaks

The comment for the I/O No. written to the Processing Box is displayed by clicking the Comment column.
If there are no comments, only the I/O No. is displayed.

Always enter a space before and after “=”.

- The Comment Input dialogue box is displayed by double-clicking the I/O No. displayed in the Comment column.
- Input a comment and click the **[OK]** button.

- 4] Click the **[OK]** button in the Processing Box.

The input of the horizontal line symbol, which connects between symbols, may be omitted. (Symbols are connected by horizontal lines by the automatic wiring function at circuit write.)

[Example of entering a timer]

- 1) Specify the input position, or omit the specification if entering it in the same circuit.
 - 2) Click the symbol for coil.
- When the specification of the input position is omitted, the cursor automatically moves to the far-right portion of the screen.

- 3) Input I/O No., time base, and the first setting value.

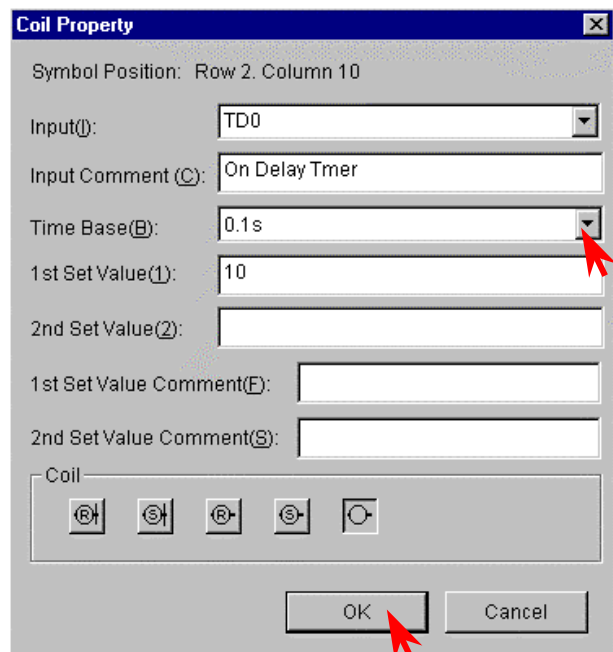

The following initials of various I/O numbers can be selected from the pull-down display of the Input field:

R, L, M, Y, TD, SS, WDT, MS, TMR, CU, RCU, CTU, CTD, CL

Input values in the necessary items, such as the time base, the first setting value, and second setting value, according to the I/O No.

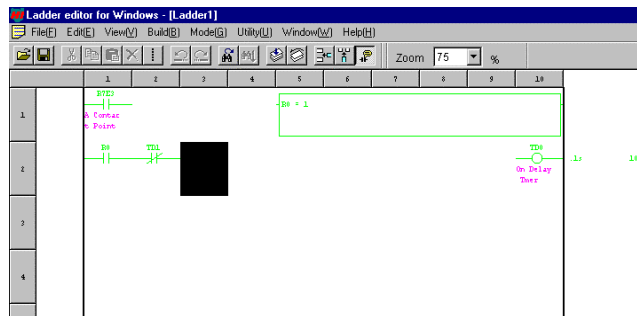

(Example) Coil

It is only necessary to enter values in the Input and Comment items.

- 4) Click the **[OK]** button to display the symbol at the cursor at the far-right portion of the circuit.

Symbols whose input positions for coils, arithmetic expressions, etc. are determined are automatically flushed to the right.

After displaying the coil, the cursor moves to the top of the next circuit.

[Example of entering a Comparison Box]

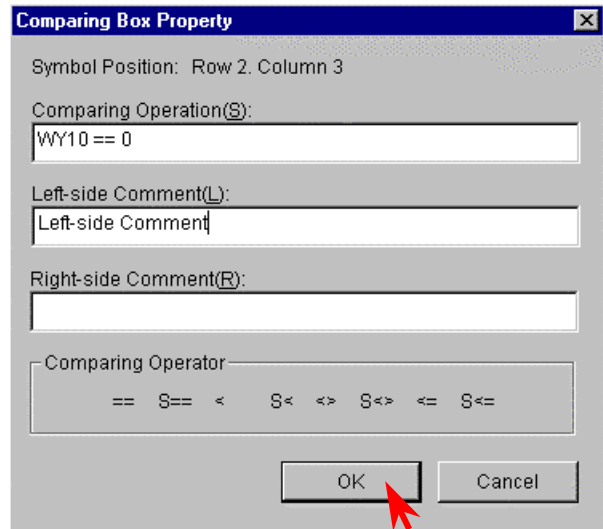

- 1) Specify the input position
- 2) Click the symbol for Comparison Box.

- 3] Input comparison expression and comment.
- 4] Click the **[OK]** button.

The comment input is valid only for I/O numbers. In this example, entering a comment for the value on the right side of the expression will not generate a comment.

Always enter a space between an I/O number and comparison operator (in this case, between “WY10” and “==”), as well as between a comparison operator and comparison data (“==” and “0”).

[Example of entering a Knot]

- 1] Specify the input position.
 - 2] Click the symbol for Knot.
- The symbol is displayed and the cursor moves to the right.

[Example of entering a Vertical Line]

- 1] Specify the input position.
 - 2] Click the symbol for Vertical Line.
- The symbol is displayed on the right side of the cursor.
The cursor does not move.

In case of the Horizontal Line symbol, the cursor does move to the right after displaying the symbol, in the same way as in the Knot symbol.

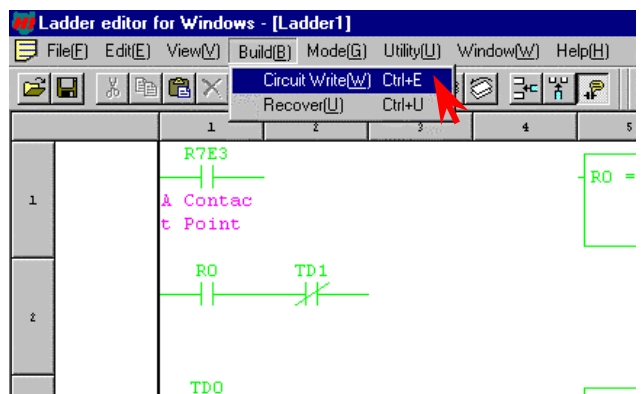

2. Writing to the program memory

Perform a “circuit write” operation by either of the following methods in order to write the circuit to the program memory.

- 1] Click **[Build]** → **[Circuit write]** in the Menu bar.

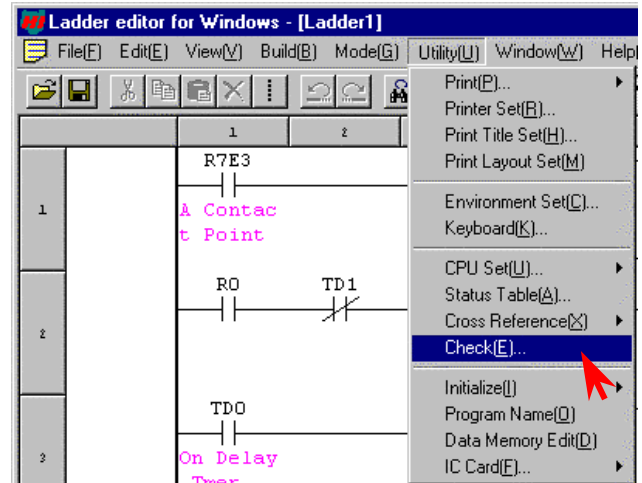

- 2] Click the **[circuit write]** icon in the tool bar.

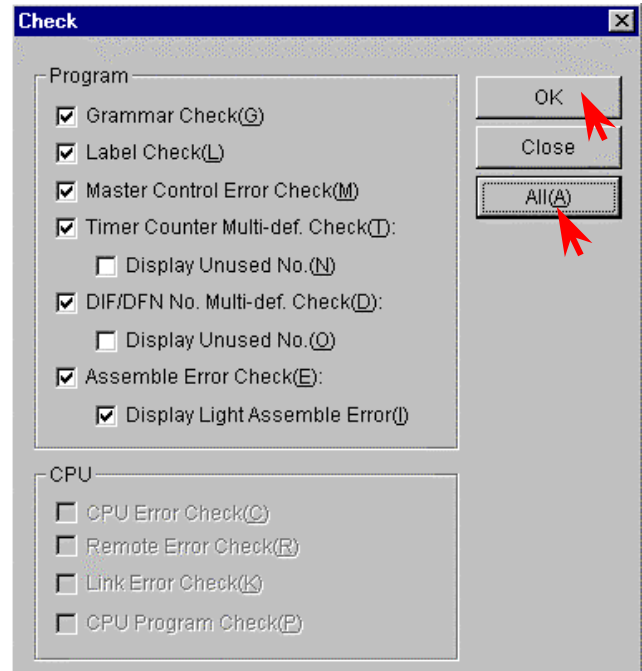

STEP 4 Checking Program Errors

Check to see if the program in the memory is correct.

Click **[Utility]** → **[Check]** in the Menu bar.
The Check dialogue box is displayed.

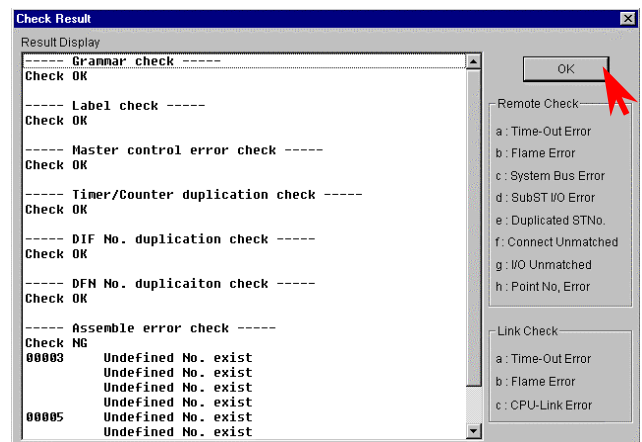

- Click the **[All items]** or the individual check column to specify the items to be checked.
 - Click the **[Execute]** button.
- The Check Result dialogue box is displayed.

The checking of the CPU can be specified at online mode.

- Click the **[OK]** button.
- The Check Result dialogue box closes.

(Note)

For example, if the I/O assignment of bit Y32 is missing for unit 1, WY10 of the sample is treated as undefined; the error is displayed as in the figure to the right.

If there are any errors, correct the errors of the program before check the program again.

STEP 5 Saving the Program

Save the program and comment that has been created to a floppy disk.

Click **[File]** → **[Record]** in the Menu bar, the

Record icon  or **[File]** → **[Batch Record]**.
The dialogue for Record or Batch Record is displayed.

Pull-down menu

Record : Specify the file type and save.
Batch Record: Saves a program and all the comment files.

Record dialogue box:

Specify the directory to save in, file name, and file type.

Batch Record dialogue box:

Specify the place to save and file name.

Click the **[Save]** button to save.

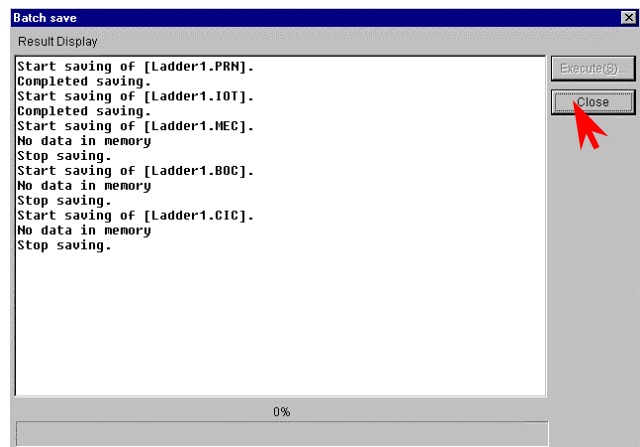

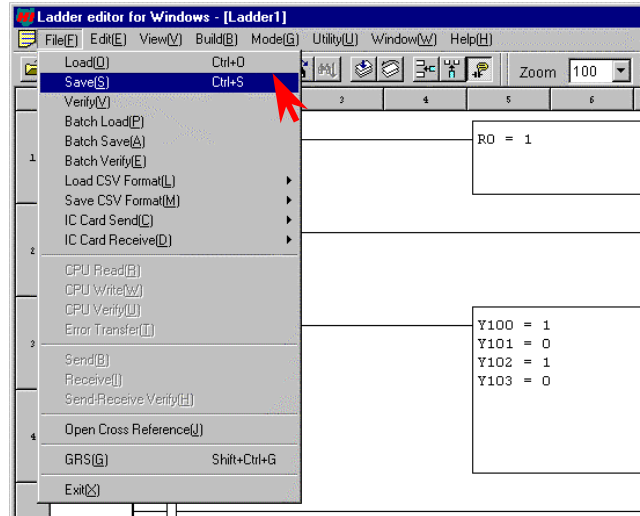

Record dialogue box

File name extensions are not necessary to input.

Record and Batch Record display the results of the save operations for one file and five files respectively.

The figure to the left shows an example of a result display for the Batch Record.

Batch Record Result dialogue box

STEP 6 Program Transfer to CPU

Write the program that has been input, to the CPU. However, verify the following:

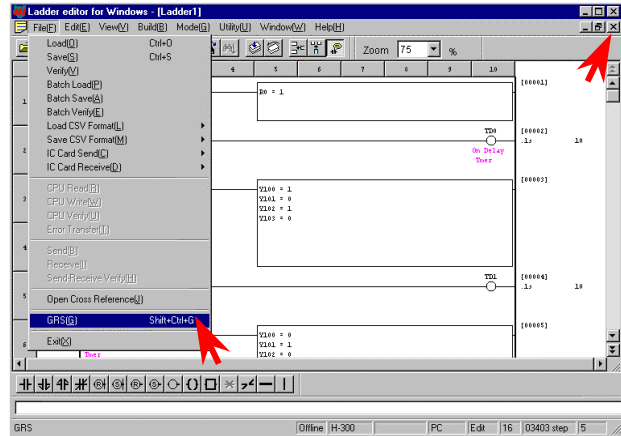

- The CPU and the personal computer connection cable are properly connected.
- The CPU power is on.
- CPU mode switch is set to “STOP.”

1. Switching to online mode.

Move to the GRS screen from the offline mode.

This can be done in two ways.

- 1] Click **[File]** → **[GRS]** in the Menu bar.
- 2] Click  (lower button) on the upper right of the screen.

In the GRS screen, click the **[Online]** item in the Menu bar.

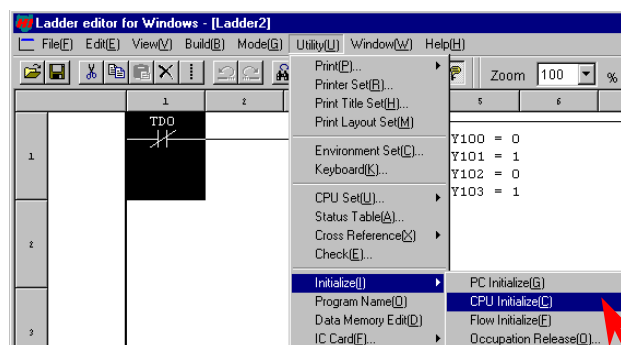

The Read/Edit screen of the online mode is displayed.

Note: Verify again that the DIP switches are set to the transmission speed selected in the Environment Setting in step 2. (For the 10-point type, it is fixed to 4800 bps.)

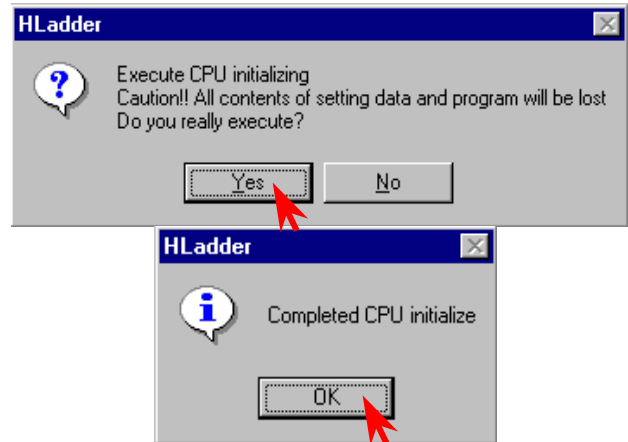

2. Initializing the CPU

Click **[Utility]** → **[Initialize]** → **[CPU initialize]** in the Menu bar.

Note: Please note that programs etc. in the personal computer will be erased if [PC initialize] is selected.

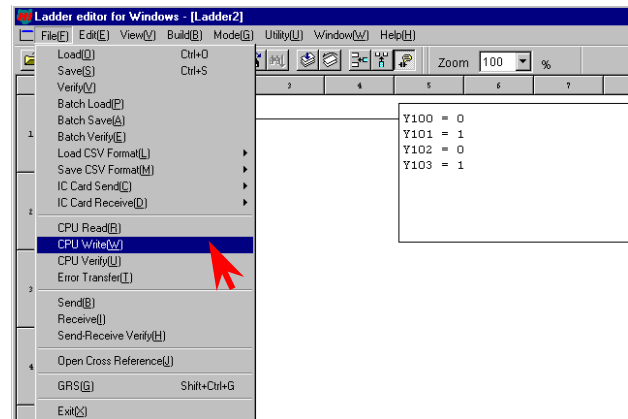

The Confirmation dialogue box is displayed; click the **[Yes]** button and start the CPU initialization.

The Exit dialogue box is displayed; click the **[OK]** button to close the dialogue.

3. Transferring to the CPU

Click **[File] → [CPU write]** in the Menu bar.

Program transfer

CPU Read: PC (personal computer) ← CPU

CPU Write: PC (personal computer) → CPU

The CPU Write dialogue box is displayed.
Click the **[Execute]** button.

When the writing is completed, the result is displayed.
Click the **[Close]** button to close the dialogue box.

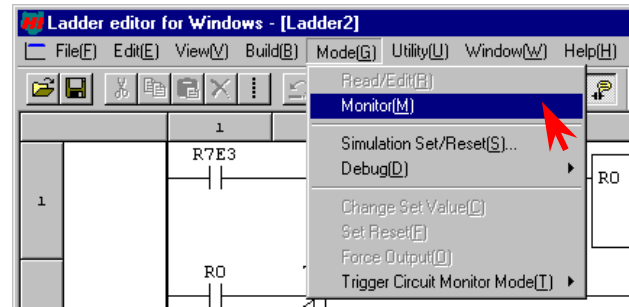

STEP 7 Monitoring (Verifying the Operation)

Monitor the program execution status in the CPU.

[Circuit monitor]

Click **[Mode]** → **[Monitor]** in the Menu bar.

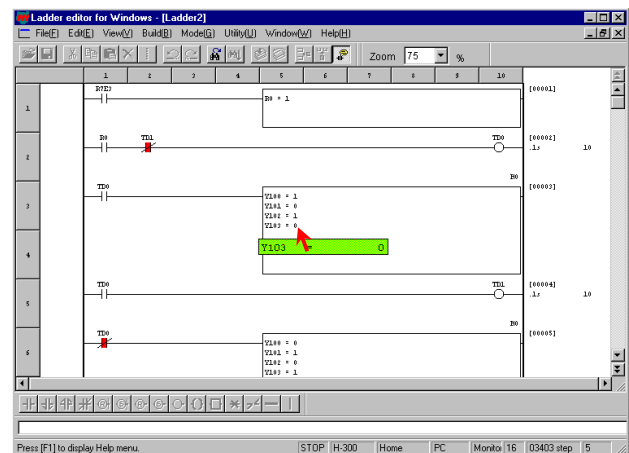

The Confirmation dialogue box for the program match check between PC and the CPU is displayed. Click the **[Yes]** button.

Set the CPU's RUN switch to "RUN" to begin the CPU operation.

The on/off status of the contact, timer, and current counter value are displayed.

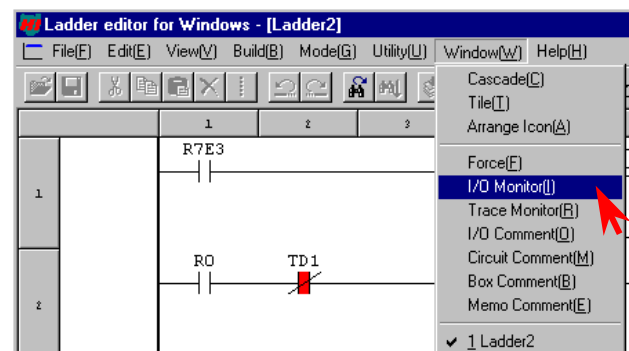

To monitor and display the current value and progress value, select comparison expression, arithmetic box, and coil (timer, counter, etc.) with the mouse arrow.

[I/O monitor]

The I/O monitor can be operated while in monitor mode.

Click **[Window]** → **[I/O Monitor]** in the Menu bar.

The I/O Monitor dialogue box is displayed.

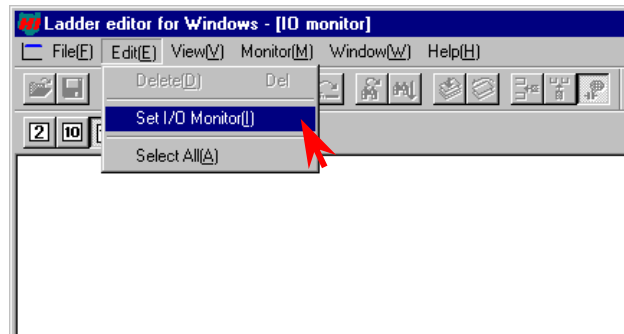

The I/O Monitor dialogue box is displayed on the Read/Edit screen at its maximum size.

The I/O monitor can be specified in the following two ways.

- 1] Click **[Edit] → [I/O monitor setting]** in the Menu bar.

- 2] Click the  icon in the Symbol bar.

I/O Monitor dialogue box

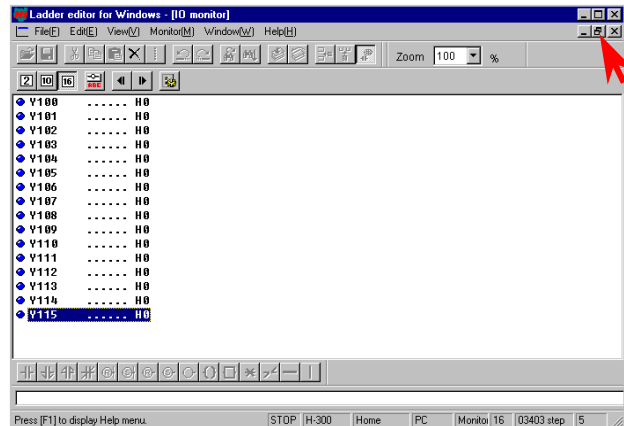

- Enter the starting I/O No.
- Click the number of points to be monitored.
- Click on either the **[Add]**, **[Insert]**, or **[Overwrite]** buttons.

I/O Monitor Setting dialogue box

Monitor and display 16 points from Y100.

I/O monitor

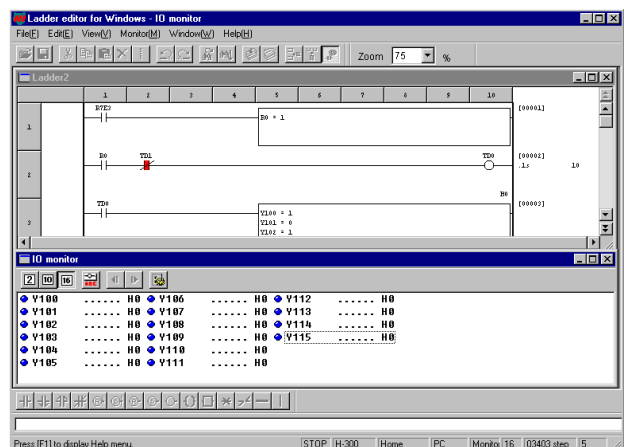

The I/O monitor can display up to 64 I/O points (up to 64 including words/double-words).

Click the I/O No. being I/O monitored and click **[Edit] → [Delete]** to delete it from the monitor.

The display size of the I/O Monitor dialogue box can be changed by clicking .

Both the circuit monitor in the Read/Edit screen and the I/O Monitor can be displayed by making their display sizes smaller to check the operation.

Display of circuit and I/O monitor

Chapter 15 Daily and Periodic Inspections

In order to use the functions of the MICRO-EH in the optimal conditions and maintain the system to operate normally, it is essential to conduct daily and periodic inspections.

(1) Daily inspection

Verify the following items while the system is running.

Table 15.1 Items for daily inspection

Item	LED display	Normal status	Main cause of error
Unit LED display *1	POW	Lighting	Power supply error, etc.
	RUN	Lighting (in RUN status)	When not lit: Microcomputer malfunction, memory error, etc. When flashing: Syntax error, congestion error, etc.
	OK	Lighting	When not lit: Microcomputer malfunction, memory error, etc. When flashing: Battery error *2

*1: The MICRO-EH indicates the error contents using the combination of lit/flashing/not lit status of OK and RUN lamps. For details, see the error code list in Chapter 12.

*2: If the power supply for the basic unit is left turned off without replacing the battery after the OK lamp was flashing, the memory contents may be destroyed. Exercise caution when the system power is turned off for a long period of time, since this error may not have been detected and the memory contents may have already been destroyed.

(2) Periodic inspection

Turn off the power for the external I/O circuit and check the following items once every six months.

Table 15.2 Items for periodic inspection

Part	Item	Check criteria	Remarks
Programming device to CPU	Check operation of programming device	Must be able to be connected online. All switches and display lamps work normally.	
Power supply	Check for voltage fluctuations	85 to 264 V AC	Tester
I/O module	Output relay life	Electrical life 200,000 times Mechanical life 20 million times	See the relay contact life curve (Chapter 10).
	LED	Turns on/off correctly	
	External power voltage	Within the specification for each I/O	See the I/O specifications (Chapter 6).
Battery (Lithium battery)	Check voltage and life	Is the OK lamp flashing? Check to see if it has been less than 2 months since the last exchange.	
Installation and connecting areas	(1) All modules are securely fixed (2) All connectors fit snugly (3) All screws are tightened (4) Damage and deterioration of each cable	There should be no problem.	Tighten Check insertion Tighten Visual check
Ambient environment	(1) Temperature (2) Humidity (3) Other	0 to 55 °C 5 to 95 % RH (no condensation) No dust, foreign matter, vibration	-
Spare parts	Check number of parts, storage condition	There should be no problem.	-
Program	Check program contents	Compare the contents of the latest program saved and CPU contents, and make sure they match.	Check both master and backup.

(3) Life of the power module

Numbers of electrolytic condensers are used in the power module. Electrolytic condensers have a lifetime and it is believed that the life is reduced by half when the ambient temperature rises 10 °C.

When stocking spare parts, the standard for consideration is that the power module has a life of approximately five years when used at the rated ambient temperature (30 °C). Also, to extend the life of the module, consider the air circulation around the module and ambient temperature when installing it.

(4) Life of the battery

- The battery life time is shown below.

Battery life time (total power off time) [Hr] *	
Guaranteed value (Min.) @55°C	Actual value (Max.) @25°C
9,000	18,000

* Battery life time has been changed since Oct. 2002 production (MFG NO.02Jxx) due to hardware modification.

- The battery life can be determined by checking for the flashing of the OK lamp.
 - The battery life time flag is in the bit special internal output "R7D9."
- An example of a circuit using "R7D9" is shown below.

The battery error can be output to external output Y00100 by using the ladder shown to the left.

* R7EE is a bit to enable battery error detection. Be sure to set R7EE if battery is used.

Figure 15.1 Battery error detection circuit

- The self-diagnostic error code "71" indicates that the battery is not loaded or that it has reached its life.
- Exchange the battery every two years even if it is still functional.
- Use the battery within one year after purchase.

(5) How to replace the battery

Figure 15.2 Replacing battery

- 1] Prepare a new battery (EH-MBAT).
 - 2] Replace the battery while the power supply to the basic base is turned on.
 - 3] Remove the old lithium battery from the battery case.
 - 4] Insert the new battery and connect the cable to the CPU module.
Insert it so that the red lead is \oplus , and the black lead is \ominus .
 - 5] Fold the excess lead and store it in the lead storage space.
(If excess lead is not stored properly, the wire may get caught on the front cover and be severed.)
- * When exchanging while the basic unit power turned off, perform steps 4], 5] and 6], in less than 30 minute.

Caution on handling the battery

Be careful when replacing the battery, since incorrect replacement may cause the battery to explode. Use EH-MBAT for new batteries.

Batteries that have been replaced should be individually placed in a suitable plastic bag (to prevent shorting) and a disposal company should be requested to dispose of them.

At this time, do not short the batteries, throw them in a fire, dismantle them, exert external force, expose them to water, charge them or cut the lead wires since doing so leads to the risk that the batteries will ignite, explode or burn up.

Appendix 1 H-Series Instruction Support Comparison Chart

[Basic instructions and sequence instructions]

No.	Instruction format	Instruction name	MICRO-EH	EH-150	H-64 ~ H-20	H-200	H-250	H-252	H-2000 H-700 H-300	H-2002 H-1002 H-702 H-302	H-4010

Supported command for EH-150 depends on CPU types. Please read EH-150 application manual for further information.

Appendix 2 Standards

MICRO-EH products are global products designed and manufactured for use throughout the world. They should be installed and used in conformance with product-specific guidelines as well as the following agency approvals and standards.

Item	Standards	
Industrial Control Equipment[Safety]	UL 508 CSA C22.2 no 142-M1987	Certification by Underwriters Laboratories for selected modules
Hazardous Locations[Safety] Class I, Div II, A,B,C,D	UL 1604 CSA C22.2 No142-M1987	Certification by Underwriters Laboratories for selected modules
European EMC Directive	IEC 61131-2 (2003)	Emission, Immunity
European Low Voltage Directive	IEC 61131-2 (1994)	
Australia C-tick mark	AS/AZN CISPR11 (2002)	

Warning:

Explosion hazard – substitution of componets may impair suitability for class I, division 2"

Do not replace modules unless power has been switched off or the area is known to be non-hazardous.

Do not disconnect equipment unless power has been switched off or the area is known to be non-hazardous.

HITACHI PROGRAMMABLE CONTROLLER

MICRO-EH

BASIC UNIT

(20-point, 40-point, 64-point type)

APPLICATION MANUAL

WARNING

To ensure that the equipment described by this manual. As well as all equipment connected to and used with it, operate satisfactorily and safely, all applicable local and national codes that apply to installing and operating the equipment must be followed. Since codes can vary geographically and can change with time, it is the user's responsibility to determine which standard and codes apply, and to comply with them.

FAILURE TO COMPLY WITH APPLICABLE CODES AND STANDARDS CAN RESULT IN DAMAGE TO EQUIPMENT AND / OR SERIOUS INJURY TO PERSONNEL.

INSTALL EMERGENCY POWER STOP SWITCH WHICH OPERATES INDEPENDENTLY OF THE PROGRAMMABLE CONTROLLER TO PROTECT THE EQUIPMENT AND / OR PERSONNEL IN CASE OF THE CONTROLLER MALFUNCTION.

Personnel who are to install and operate the equipment should carefully study this manual and any others referred to by it prior to installation and / or operation of the equipment. Hitachi, Ltd. constantly strives to improve its products, and the equipment and the manual(s) that describe it may be different from those already in your possession.

If you have any questions regarding the installation and operation of the equipment, or if more information is desired, contact your local Authorized Distributor or Hitachi, Ltd.

IMPORTANT

THIS EQUIPMENT GENERATES, USES, AND CAN RADIATE RADIO FREQUENCY ENERGY AND, IF NOT INSTALLED AND USED IN ACCORDANCE WITH THE INSTRUCTION MANUAL, MAY CAUSE INTERFERENCE TO RADIO COMMUNICATIONS. AS TEMPORARILY PERMITTED BY REGULATION, IT HAS NOT BEEN TESTED FOR COMPLIANCE WITH THE LIMITS FOR CLASS A COMPUTING DEVICES PURSUANT TO SUBPART J OF PART 15 OF FCC RULES, WHICH ARE DESIGNED TO PROVIDE REASONABLE PROTECTION AGAINST SUCH INTERFERENCE.

OPERATION OF THIS EQUIPMENT IN A RESIDENTIAL AREA IS LIKELY TO CAUSE INTERFERENCE IN WHICH CASE THE USER, AT HIS OWN EXPENSE, WILL BE REQUIRED TO TAKE WHATEVER MEASURES MAY BE REQUIRED TO CORRECT THE INTERFERENCE.

LIMITED WARRANTY AND IMITATION OF LIABILITY

Hitachi, Ltd. (Hitachi) warrants to the original purchaser that the programmable controller (PLC) manufactured by Hitachi is free from defects in material and workmanship under normal use and service. The obligation of Hitachi under this warranty shall be limited to the repair or exchange of any part or parts which may prove defective under normal use and service within eighteen (18) months from the date of manufacture or twelve (12) months from the date of installation by the original purchaser which ever occurs first, such defect to be disclosed to the satisfaction of Hitachi after examination by Hitachi of the allegedly defective part or parts. This warranty is expressly in lieu of all other warranties expressed or implied including the warranties of merchantability and fitness for use and of all other obligations or liabilities and Hitachi neither assumes, nor authorizes any other person to assume for Hitachi, any other liability in connection with the sale of this PLC. This warranty shall not apply to this PLC or any part hereof which has been subject to accident, negligence, alteration, abuse, or misuse. Hitachi makes no warranty whatsoever in respect to accessories or parts not supplied by Hitachi. The term "original purchaser", as used in this warranty, shall be deemed to mean that person for whom the PLC is originally installed.

In no event, whether as a result of breach of contract, warranty, tort (including negligence) or otherwise, shall Hitachi or its suppliers be liable for any special, consequential, incidental or penal damages Including, but not limited to, loss of profit or revenues, loss of use of the products or any associated equipment, damage to associated equipment, cost of capital, cost of substitute products, facilities, services or replacement power, down time costs, or claims of original purchaser's customers for such damages.

To obtain warranty service, return the product to your distributor, or send it with a description of the problem, proof of purchase, post paid, insured, and in a suitable package to:

All Rights reserved - Printed in Japan

The information and/or drawings set forth in this document and all rights in and to inventions disclosed herein and patents which might be granted thereon disclosing or employing and the materials, techniques or apparatus described herein are the exclusive property of Hitachi, Ltd.

No copies of the information or drawings shall be made without the prior consent of Hitachi, Ltd.

Hitachi, Ltd. provides customer assistance in varied technical areas. Since Hitachi does not possess full access to data concerning all of the uses and applications of customer's products, responsibility is assumed by Hitachi neither for customer product design nor for any infringements of patents or rights of others which may result from Hitachi assistance.

The specifications and descriptions contained in this manual were accurate at the time they were approved for printing. Since Hitachi, Ltd. Incorporated constantly strives to improve all its products, we reserve the right to make changes to equipment and/or manuals at any time without notice and without incurring any obligation other than as noted in this manual.

Hitachi, Ltd. assumes no responsibility for errors that may appear in this manual.

As the product works with user program and Hitachi, Ltd. cannot test all combination of user program components, it is assumed that a bug or bugs may happen unintentionally. If it is happened: please inform the fact to Hitachi, Ltd. or its representative. Hitachi will try to find the reason as much as possible and inform the countermeasure when obtained.

Nevertheless Hitachi, Ltd. intends to make products with enough reliability, the product has possibility to be damaged at any time. Therefore personnel who are to install and operate the equipment has to prepare with the counter-measure such as power off switch can be operated independently of the controller. Otherwise, it can result in damage to equipment and/or serious injury to personnel.

Safety Precautions

Read this manual and attached documents thoroughly before installing and operating this unit, and performing maintenance or inspection of this unit in order to use the unit correctly. Be sure to use this unit after acquiring adequate knowledge of the unit, all safety information, and all precautionary information. Also, be sure to deliver this manual to the person in charge of maintenance.

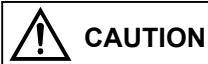

Safety caution items are classified as “Danger” and “Caution” in this document.

: Cases in which, if handled incorrectly, a dangerous situation may occur, resulting in possible death or severe injury.

: Cases in which, if handled incorrectly, a dangerous situation may occur, resulting in possible minor to medium injury to the body, or only mechanical failure.

However, depending on the situation, items marked with  may result in major accidents.

Both of these items contain important safety information, so be sure to follow them closely.

Icons for prohibited items and required items are shown below:

: Indicates a prohibited item (item that cannot be performed). For example, when open flames are prohibited,  is shown.

: Indicates a required item (item that must be performed). For example, when grounding must be performed,  is shown.

1. Installation

CAUTION

- Use this product in an environment as described in the catalogue and this document.
If this product is used in an environment subject to high temperature, high humidity, excessive dust, corrosive gases, vibration or shock, it may result in an electric shock, fire or malfunction.
- Installation this product according to the instructions in this manual.
If installation is not performed correctly, it may result in falling, malfunction, or an operational error of the unit.
- Never allow foreign objects such as wire chips to enter the unit.
They may cause a fire, malfunction, or failure.

2. Wiring

REQUIRED

- Always perform grounding (FE terminal).
If grounding is not performed, there is a risk of an electric shock or malfunction.

CAUTION

- Connect a power supply that meets the rating.
If a power supply that does not meet the rating is connected, it may result in a fire.
- Any wiring operation should only be performed by a qualified technician.
If wiring is performed incorrectly, it may result in a fire, failure, or electric shock.

3. Precautions When Using the Unit

DANGER

- Never touch the terminals while the power is on.
There is a risk of an electric shock.
- Configure the emergency stop circuit, interlock circuit and other related circuits external to the programmable controller (referred to as the PLC in this document).
Otherwise, a failure in the PLC may damage the equipment or result in a serious accident.
Never interlock the unit with the external load via the relay drive power supply of the relay output module.

CAUTION

- Before performing program change, forced output, run, stop and other operations while the unit is in operation, be sure to check the validity of the applicable operation and safety.
An operation error may damage the equipment or result in a serious accident.
- Be sure to power on the unit according to the designated power-on sequence.
Otherwise, an erroneous operation may damage the equipment or result in a serious accident.

4. Maintenance

DANGER

- Never connect the \oplus and \ominus of the battery in reverse. Also, never charge, disassemble, heat, place in fire, or short circuit the battery.
There is a risk of an explosion or fire.

PROHIBITED

- Never disassemble or modify the unit.
These actions may result in a fire, malfunction, or failure.

CAUTION

- Be sure to turn off the power supply before removing or attaching the module/unit.
Otherwise, it may result in an electric shock, malfunction, or failure.

Chapter 1 Introduction

Thank you for using the Hitachi MICRO-EH Programmable Controller series (hereinafter called PLC). This manual describes how to use the MICRO-EH 20-point, 40-point, and 64-point type basic unit (hereinafter called MICRO20/40/64). Please refer to the MICRO-EH application manual (NJI-349*) about common contents with MICRO-EH series other than description in this book.

The MICRO-EH application manual has the following contents.

Table 1.1 Contents of application manual

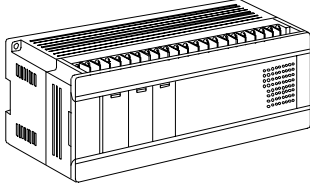

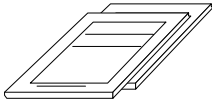

Chapter		Contents
Chapter 1	Features	About the features of MICRO-EH series.
Chapter 2	System overview	The example of a system overview of MICRO-EH series
Chapter 3	Function and Performance Specifications	About various specifications (general specification, functional specification etc.)
Chapter 4	Product lineup and wiring	The name and function of each part of a unit.
Chapter 5	Instruction Specifications	The function of various ladder commands, the example of programming
Chapter 6	I/O Specifications	About an external I/O number and an internal output number
Chapter 7	Programming	About programming device and the programming method
Chapter 8	High speed counter, PWM/Pulse train output and Analogue I/O	The setting method and directions of High speed counter / PWM, Pulse output.
Chapter 9	PLC Operation	About the processing method of a program. (From an operation start to under operation)
Chapter 10	PLC Installation, Mounting, Wiring	About installation of MICRO-EH, and wiring
Chapter 11	Communication Specifications	The specification of a communication port, the setting method, etc.
Chapter 12	Error Code List and Special Internal Outputs	About error code details and the special internal outputs.
Chapter 13	Troubleshooting	The management flow at the time of trouble generating
Chapter 14	Operation Examples	An easy example explains even from creation of a program to transmission and operation.
Chapter 15	Daily and Periodic Inspections	About the item checked every day or periodically

1.1 Before use

Great care has been taken in the manufacture of this product, but it is advised that the following points are checked immediately after purchase.

1. Is the model the same one that you ordered?
 2. Is not the product damaged?
 3. Is not any of the accessories listed in table 1.2 missing?
- Contact your dealer in the event of any defects being discovered.

Table 1.2 List of accessories supplied with the MICRO20/40/64

No.	Products name	Model name	Outlook	Q'ty	Remarks
1	PLC	EH-A64DR EH-D64DR EH-D64DT EH-D64DTPS EH-A40DR EH-D40DR EH-D40DT EH-D40DTPS EH-A20DR EH-D20DR EH-D20DT EH-D20DTPS		1	
2	Instruction manual	NJI-463		1	

1.2 Features

MICRO20/40/64 is all-in-one compact type PLC which has the following features in addition to existing MICRO-EH series (10, 14, 23, and 28-point type).

■ Increase in I/O points

The 64-point type has 40 inputs and 24 outputs. The number of I/O points is expandable to 176 points with 4 expansion units.

The 40-point type has 24 inputs and 16 outputs. The number of I/O points is expandable to 152 points with 4 expansion units.

The 20-point type has 12 inputs and 8 outputs. The number of I/O points is expandable to 132 points with 4 expansion units.

■ Increase in programming memory and data memory (WR)

Program capacity is extended to 16k steps, and data memory capacity is extended to 32k words, which enables MICRO64 to support middle range applications.

■ New FUN commands

53 kinds of FUN commands and one application command are added. The added FUN commands are a data conversion command, a floating point arithmetic, etc. (they are the command currently supported by EH-150 series.)

■ 32 bits counter

The counter of MICRO20/40/64 can support up to 100kHz(single phase) or 60kHz (2-phase) pulses. The 16-bit counter is extended to the 32-bit counter.

■ Pulse train output

A pulse output with an output frequency of 65kHz is possible for MICRO20/40/64. Moreover, the number of output pulses can be set up by 32 bits. (32bit pulse is supported by software ver. 1.01 or later.)

■ PWM output

A pwm output with an output frequency of 65kHz is possible for MICRO20/40/64.

■ Compatibility with current MICRO-EH series

The command system of MICRO20/40/64 does not change with current MICRO-EH. Ladder program for the current MICRO-EH works on MICRO64 also. In addition, it is possible to connect existing expansion unit.

■ Selectable option boards

A function is expandable by attaching an option board in a basic unit. The following option boards will be released.

- RS-422/485 communication board
 - ... RS-422/485 Interface. It can be used as an programming port or a general-purpose port.
10 bits analog inputs (2ch) are attached.
- RS-232C communication board
 - ... RS-232C Interface. It can be used as an programming port or a general-purpose port.
10 bits analog inputs (2ch) are attached.
- Memory board
 - ... It can be used for backup of a user program etc.

Caution

Since above option boards have not been released yet, the first version of MICRO64 may not support all the option boards.

■ LED indication for FLASH memory writing of user program

If a power supply is turned off during FLASH memory writing, "user memory error (error code 31)" may occur at the next time of a power supply ON.

In the current MICRO-EH, it was monitored in special internal output(R7EF). In MICRO20/40/64, this can be visually checked in OK LED.

Chapter 2 MICRO20/40/64 Unit

2.1 List of System Equipment

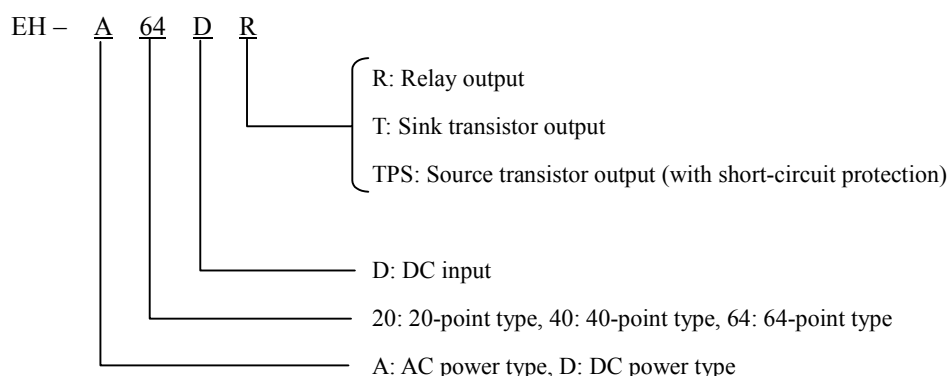

(1) Basic equipment

■ Basic unit

Table2.1 List of system equipment (20-point/40-point/60-point basic unit)

Model name	Specifications	I/O assignment symbol
EH-A64DR	AC power supply, DC input 40 points, Relay output 24 points	X48 / Y32 / Vacant 16 points
EH-D64DR	DC power supply, DC input 40 points, Relay output 24 points	
EH-D64DT	DC power supply, DC input 40 points, Transistor output 24 points (sink)	
EH-D64DTPS	DC power supply, DC input 40 points, Transistor output 24 points (source) (20 points with short-circuit protection)	
EH-A40DR	AC power supply, DC input 24 points, Relay output 16 points	X48 / Y32 / Vacant 16 points
EH-D40DR	DC power supply, DC input 24 points, Relay input 16 points	
EH-D40DT	DC power supply, DC input 24 points, Transistor output 16 points (sink)	
EH-D40DTPS	DC power supply, DC input 24 points, Transistor output 16 points (source) (12 points with short-circuit protection)	
EH-A20DR	AC power supply, DC input 12 points, Relay output 8 points	X48 / Y32 / Vacant 16 points
EH-D20DR	DC power supply, DC input 12 points, Relay output 8 points	
EH-D20DT	DC power supply, DC input 12 points, Transistor output 8 points (sink)	
EH-D20DTPS	DC power supply, DC input 12 points, Transistor output 8 points (source) (4 points with short-circuit protection)	

Each digit in the model name has the following meaning.

(2) Others

Model name	Usage	Remarks
EH-MBATL	Lithium battery	For 20-point/40-point/60-point

Note that the lithium battery [Model: EH-MBAT] for the 23-point/28-point types cannot be used for the 20-point/40-point/64-point type.

2.2 Name and function of each part

64-point Basic unit		Type	EH-A64DR, EH-D64DR, EH-D64DT, EH-D64DTPS	
		Weight	EH-A64DR : 0.72 kg	EH-D64DR : 0.64 kg
			EH-D64DT : 0.64 kg	EH-D64DTPS : 0.64 kg

11] Terminal cover

13] DIN rail installation clip (behind the unit)

5] Input terminals

2] OK LED

3] RUN LED

8] Expansion cover

6] Output terminals

7] Power terminal

10] Option board cover

9] Battery cover

4] Serial port cover

12] Mounting hole

No.	Item	Detailed explanation
1]	POW LED	Lighting when the power is supplied.
2]	OK LED	Lighting at normal operation. (The 20/40/64 pts. type displays under FLASH memory backup in OK LED. Please refer to "Chapter 3 Programming" for details.)
3]	RUN LED	Lighting at RUN status.
4]	Serial port cover	Cover for the connector for connecting peripheral units, the RUN switch and the DIP switch. When the cover is opened, the RUN switch, RS-232C serial port 1 (PORT 1) and DIP switch can be used. The communication specification is set to port 1.
5]	Input terminals	Terminals for wiring the external input units. Recommended terminals are shown in the figure to the right. One piece of AWG14 to AWG22 (2.1 to 0.36 mm ²) or two pieces of AWG16 to AWG22 (1.3 to 0.36 mm ²) per terminal may be wired.
6]	Output terminals	Terminals for connecting the external load. The wiring specification is the same as for the input terminals.
7]	Power terminal	Terminal for connecting the power supply. The wiring specification is the same as for the input terminals.
8]	Expansion cover	Cover for the expansion connector
9]	Battery cover	Cover for the backup battery storage unit.
10]	Option board cover	Cover for the option board attachment part. This cover is removed in attaching the option board.
11]	Terminal cover	Cover for terminals
12]	Mounting hole	Used when installing the PLC with screws
13]	DIN rail installation clip	Used when installing the PLC on a DIN rail

		Weight	EH-A40DR : 0.56 kg	EH-D40DR : 0.48 kg
			EH-D40DT : 0.45 kg	EH-D40DTPS : 0.45 kg
			EH-A20DR : 0.55 kg	EH-D20DR : 0.47 kg
			EH-D20DT : 0.45 kg	EH-D20DTPS : 0.45 kg

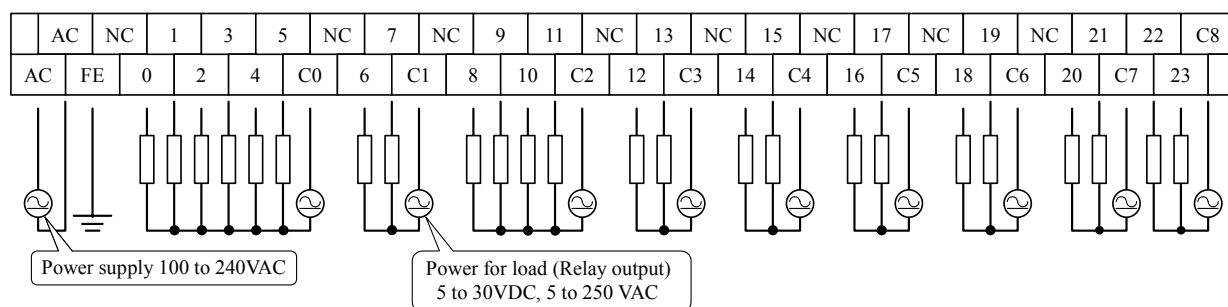

No.	Item	Detailed explanation
1]	POW LED	Lighting when the power is supplied.
2]	OK LED	Lighting at normal operation. (The 20/40/64 pts. type displays under FLASH memory backup in OK LED. Please refer to "Chapter 3 Programming" for details.)
3]	RUN LED	Lighting at RUN status.
4]	Serial port cover	Cover for the connector for connecting peripheral units, the RUN switch, and the DIP switch. When opening the cover, the RUN switch, RS-232C serial port 1 (PORT 1), and the DIP switch can be used. The communication specification is set to the port 1.
5]	Input terminals	Terminals for wiring the external input units. Recommended terminals are shown in the figure to the right. One piece of AWG14 to AWG22 (2.1 to 0.36 mm ²) or two pieces of AWG16 to AWG22 (1.3 to 0.36 mm ²) per terminal may be wired.
6]	Output terminals	Terminals for connecting the external load. The wiring specification is the same as for the input terminals.
7]	Power terminal	Terminal for connecting the power supply. The wiring specification is the same as for the input terminals.
8]	Expansion cover	Cover for the expansion connector.
9]	Battery cover	Cover for the backup battery storage unit.
10]	Option board cover	Cover for the option board attachment part. This cover is removed in attaching the option board.
11]	Terminal cover	Cover for terminals.
12]	Mounting hole	Used when installing the PLC with screws.
13]	DIN rail installation clip	Used when installing the PLC on a DIN rail.

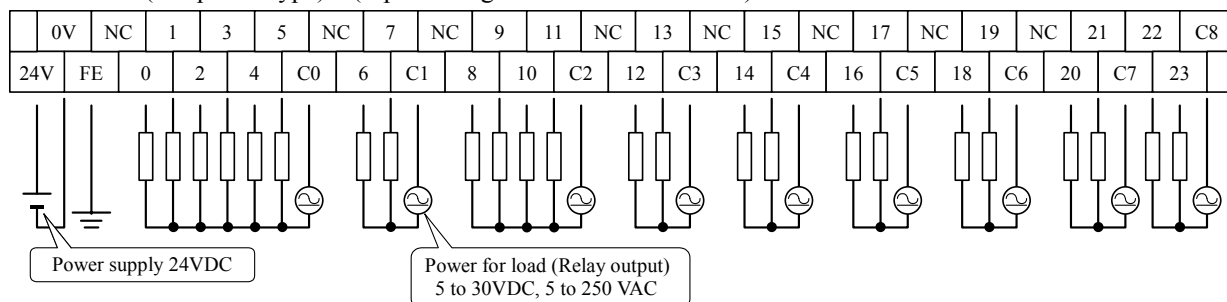

■ Terminal layout and wiring [64-point type]

EH-A64DR (AC power type)

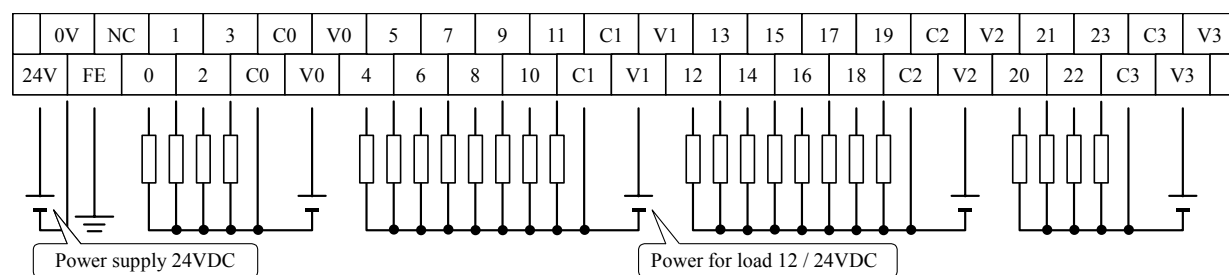

* For the DC input, both sink and source types are available. It is possible to reverse the polarity of 24VDC.

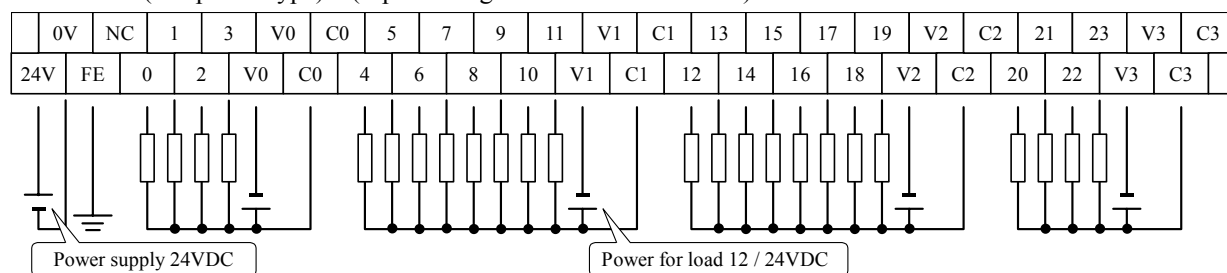

EH-D64DR (DC power type) (Input wiring is same as EH-A64DR)

EH-D64DTPS (DC power type) (Input wiring is same as EH-A64DR)

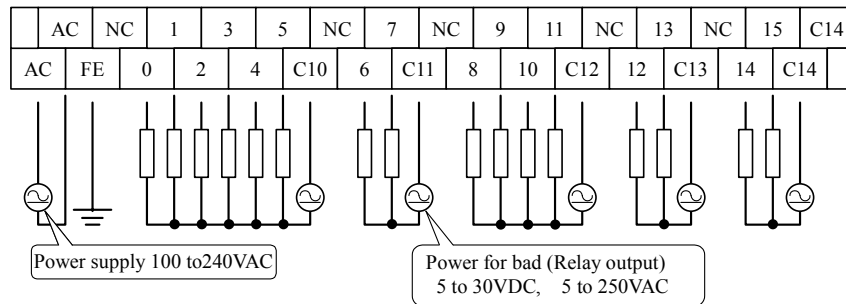

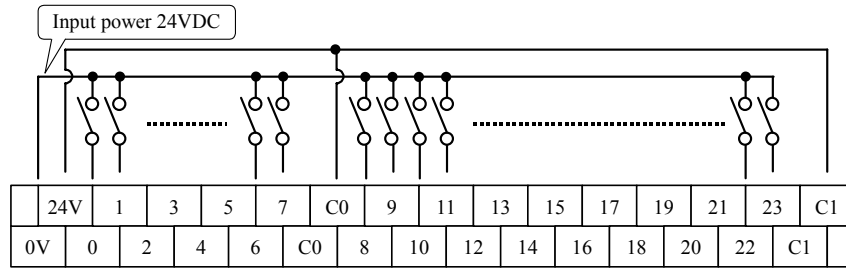

EH-D64DT (DC power type) (Input wiring is same as EH-A64DR)

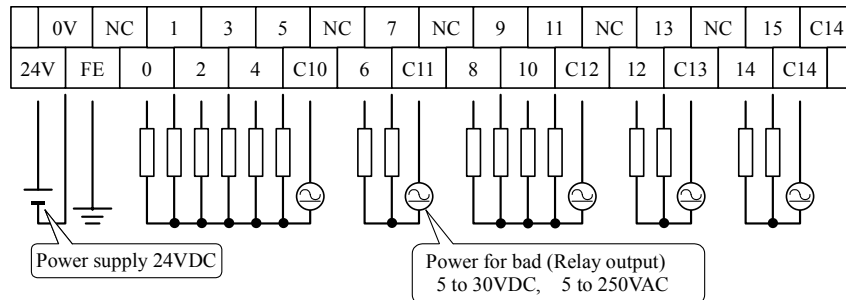

■ Terminal layout and wiring [40-point type]

EH-A40DR (AC power type)

* For the DC input, both sink and source types are available. It is possible to reverse the polarity of 24 VDC.

EH-D40DR (DC power type) (Input wiring is same as EH-A40DR.)

EH-D40DTPS (DC power type) (Input wiring is same as EH-A40DR.)

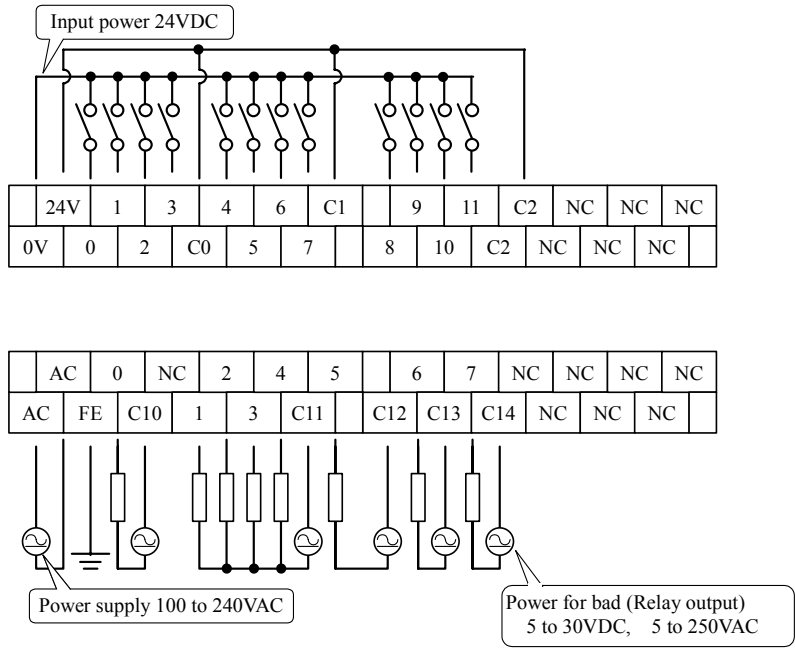

EH-D40DT (DC power type) (Input wiring is same as EH-A40DR.)

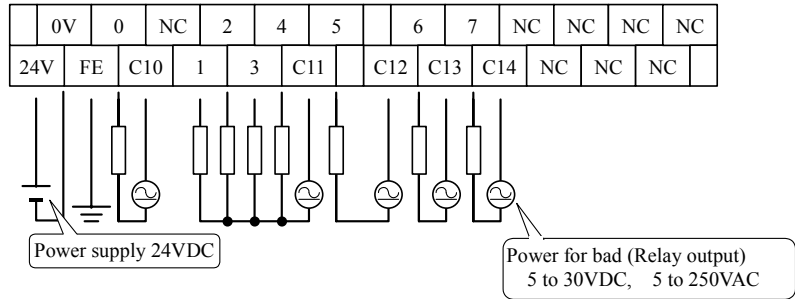

■ Terminal layout and wiring [20-point type]

EH-A20DR (AC power type)

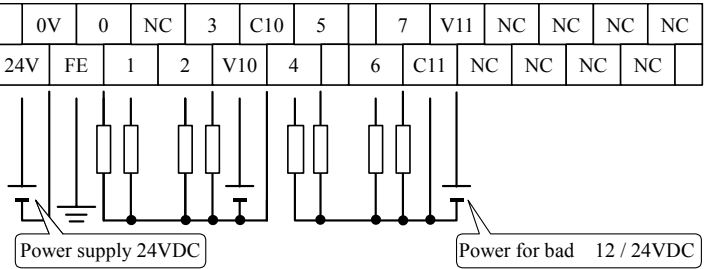

* For the DC input, both sink and source types are available. It is possible to reverse the polarity of 24 VDC.

EH-D20DR (DC power type) (Input wiring is same as EH-A20DR.)

EH-D20DTPS (DC power type) (Input wiring is same as EH-A20DR.)

EH-D20DT (DC power type) (Input wiring is same as EH-A20DR.)

Wiring to the input terminals

Item	DC input	DC input (High Speed Counter)
External wiring	<p>Current output type Proximity switch</p>	<p>Rotary encoder</p> <p>< Note > In case the maximum count speed is more than 30kHz in 2-phase count or 60kHz in single phase, additional resistor is needed as shown in diagram.</p>

Wiring to the output terminals

Item	Relay output (EH-***DR)
External wiring	<p>Surge killer</p> <p>Fuse</p>

Wiring to the output terminals

Item	Transistor output (sink type) (EH-***DT)	Transistor output (source type) (EH-***TPS)
External wiring	<p>Diode</p> <p>Fuse</p>	<p>Diode</p> <p>Fuse</p>

2.3 General Specifications

Item	Specification	
Power supply type	AC	DC
Power voltage	100/110/120 V AC (50/60 Hz), 200/220/240 V AC (50/60 Hz)	24 V DC
Power voltage fluctuation range	85 to 264 V AC wide range	19.2 to 30 V DC
Current consumption	Refer to Chapter 2.9 "Current Consumption".	
Allowable momentary power failure	85 to 100 V AC: For a momentary power failure of less than 10 ms, operation continues 100 to 264 V AC: For a momentary power failure of less than 20 ms, operation continues	19.2 to 30 V DC: For a momentary power failure of less than 10 ms, operation continues
Operating ambient temp.	0 to 55 °C	
Storage ambient temp.	-10 to 75 °C	
Operating ambient humidity	5 to 95 % RH (no condensation)	
Storage ambient humidity	5 to 95 % RH (no condensation)	
Vibration proof	Conforms to JIS C 0911	
Noise resistance	<ul style="list-style-type: none"> ○ Noise voltage 1,500 Vpp Noise pulse width 100 ns, 1 μs (Noise created by the noise simulator is applied across the power supply module's input terminals. This is determined by our measuring method.) ○ Based on NEMA ICS 3-304 ○ Static noise: 3,000 V at metal exposed area ○ Conforms with EN50081-2 and EN50082-2 	
Supported standards	Conforms with UL, CE markings and C-TICK	
Insulation resistance	20 MΩ or more between the AC external terminal and the protection earth (PE) terminal (based on 500 V DC megger)	
Dielectric withstand voltage	1,500 V AC for one minute between the AC external terminal and the protection earth (PE) terminal	
Grounding	Class D dedicated grounding (grounded by a power supply module)	
Environment used	No corrosive gases and no excessive dirt	
Structure	Attached on an open wall	
Cooling	Natural air cooling	

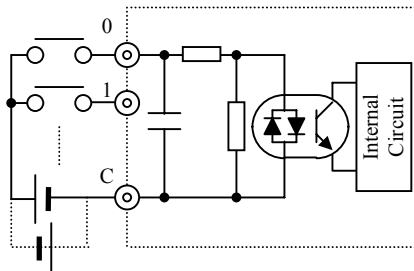

2.4 Performance Specifications

Spec.	Item		64-pts type	40-pts type	20-pts type	[Reference] 28 pts. type	
Control Spec.	CPU		32-bit RISC processor				
	Processing system		Stored program cyclic system				
	Processing	Basic	0.9 μs / instruction				
	Speed	Application	Several 10 μs / instruction				
	User program memory		16 ksteps max. (FLASH memory)		3 ksteps max. (FLASH memory)		
Operation Spec.	Ladder	Basic	39 types such as 				
		Arithmetic Application	132 types such as arithmetic, application, control, FUN, etc.		78 types such as arithmetic, application, control, FUN, etc.		
I/O processing Spec.	External I/O	I/O processing system		Refresh processing			
		Max. number of points		176 pts.	152 pts.	132 pts.	140 pts.
	Internal output	Bit		1,984 pts. (R0 to R7BF)			
		Word		32,768 words (WR0 to WR7FFF)		4,096 words (WR0 to WRFFF)	
		Special	Bit	64 pts. (R7C0 to R7FF)			
			Word	512 words (WRF000 to WRF1FF)			
		Bit/Word shared		16,384 pts. 1,024 words (M0 to M3FFF, WM0 to WM3FF)			
	Timer / counter	Number of points		512 pts. (TD+CU) However, TD is up to 256 pts. * ¹			
		Timer set value		0 to 65,535, timer base 0.01 s, 0.1 s, 1 s (64 pts. are maximum for 0.01 s * ²)			
		Counter set value		1 to 65,535 times			
Edge detection		512 pts. (DIF0 to DIF511:decimal) + 512 pts. (DFN0 to DFN511:decimal)					
Peripheral equipment	Program system		Command language, ladder program				
	Peripheral unit		Programming software (LADDER EDITOR DOS version / Windows® version, Pro-H) Command language programmer, portable graphic programmer cannot be used.				

*1 The same numbers cannot be shared by the timer and the counter. TD is 0 to 255.

*2 Only timers numbered 0 to 63 can use 0.01s for their time base.

2.5 Input specifications

Item		Specification		Internal Circuit
		X0, X2, X4, X6	Except the following	
Input voltage		24V DC		
Allowable input voltage range		0 to 30V DC		
Input impedance		Approximately 2.7 kΩ	Approximately 4.7 kΩ	
Input current		8 mA typical	4.8 mA typical	
Operating voltage	ON voltage	18 VDC (min) / 4.5mA (max)	18 VDC (min) / 3.3mA (max)	
	OFF voltage	5 VDC (min) / 1.8mA (max)	5 VDC (max) / 1.6mA (max)	
Input lag	OFF → ON	2 to 20 ms (user setup is possible.) *		
	ON → OFF	2 to 20 ms (user setup is possible.) *		
Number of input points		64-point type : 40 points 40-point type : 24 points 20-point type : 12 points		
Number of common points		Refer to Chapter 2 Terminal layout and wiring.		
Polarity		None		
Insulation system		Photocopier insulation		
Input display		LED (Green)		
External connection		Removable type screw terminal block (M3)		

- The digital filter of MICRO20/40/64 is 2 - 20ms (WRF07F setting values 4-40). If 0-3 are set up, it will become a setup for 2ms.
- There is 2ms delay by hardware. If set up the filter time at 2ms, actual delay is from 2ms to 4ms.

■ High speed counter

Item		Single	2-phase
Choices for counter input channels		X0, X2, X4, X6	Use X0 and X2 in pair / Use X4 and X6 in pair
Input voltage	ON	18 V	
	OFF	5 V	
Width of count pulse		10 μ s	17 μ s
Maximum count frequency		100 kHz	60 kHz
Count register		16 bits / 32 bits (depend on operation mode)	
Coincidence output		Possible (or assigned as standard output)	
ON / OFF preset		Possible (or assigned as standard output)	
Upper / lower limit setting		Impossible (16 bits counter : ring counter ... 0 to 65,535) (32 bits counter : ring counter ... 0 to 4,294,967,295)	
Pre-load / Strobe		Possible (or assigned as standard input)	

2.6 Output specifications

(1) Relay output (All output of EH-*64DR, EH-*40DR, EH-*20DR)

Item		Specification	Internal Circuit
Rated load voltage		5 to 250V AC, 5 to 30V DC	
Minimum switching current		10 mA (5V DC)	
Maximum load current	1 circuit	2A (24V DC, 240V AC)	
	1 common	5A	
Output response time	OFF → ON	15 ms (max)	
	ON → OFF	15 ms (max)	
Number of output points		64-point type : 24 points 40-point type : 16 points 20-point type : 8 points	
Number of common points		Refer to Chapter 2 Terminal layout and wiring.	
Surge removal circuit		None	
Fuse		None	
Insulation system		Relay insulation	
Output display		LED (Green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power (For driving relays)		Not used	
Contact life ^{*1}		20,000,000 times (mechanical) 200,000 times (electrical : 2A)	
Insulation		1500V or more (external - internal) 500V or more (external - external)	

*1 : Please refer to the following figure.

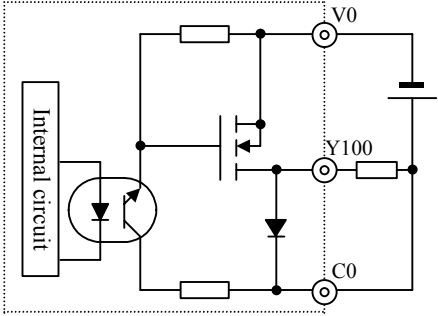

Life of relay contacts

Since the lifetime of relay contact is in inverse proportion to squared current, be aware that interrupting rush current or directly driving the condenser load will drastically reduce the life of the relay.

If switching frequency is very high, transistor output is recommended to use.

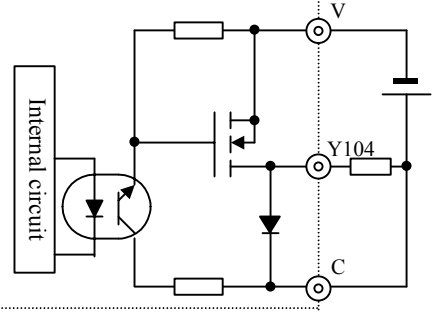

(2) DC output (Y100 - Y103 of EH-D64DT, EH-D40DT, EH-D20DT)

Item		Specification	Circuit diagram
Output specification		Transistor output	
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		10 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	0.5 A 24 V DC / 0.3 A 12 V DC	
	1 common	2.0 A	
Output response time	OFF → ON	5 μs (max) 24 V DC 0.2A	
	ON → OFF	5 μs (max) 24 V DC 0.2A	
Number of output points		4 points	
Number of common *1		1 points	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *2		12 to 30 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: V and C terminals are separated each output terminal. Refer to “Chapter 2 Terminal layout and wiring” for more information.

*2: It is necessary to supply 12 to 30 V DC between the V and C terminals externally.

(3) DC output (Y104 - Y123 of EH-D64DT, EH-D40DT, EH-D20DT)

Item		Specification	Circuit diagram
Output specification		Transistor output	
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		10 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	0.5 A	
	1 common	64-point type : 3.0 A 40-point type : 5.0 A 20-point type : 2.0 A	
Output response time	OFF → ON	0.1 ms (max) 24 V DC	
	ON → OFF	0.1 ms (max) 24 V DC	
Number of output points		64-point type : 20 points 40-point type : 12 points 20-point type : 4 points	
Number of common *1		Refer to Chapter 2 Terminal layout and wiring.	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *2		12 to 30 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: V and C terminals are separated each output terminal. Refer to Chapter 2 Terminal layout and wiring for more information.

*2: It is necessary to supply 12 to 30 V DC between the V and C terminals externally.

(4) DC output (Y100 - Y103 of EH-D64DTPS, EH-D40DTPS, EH-D20DTPS)

Item		Specification	Circuit diagram
Output specification		Transistor output	
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		10 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	0.5 A 24 V DC / 0.3 A 12 V DC	
	1 common	2.0 A	
Output response time	OFF → ON	5 μs (max) 24 V DC 0.2A	
	ON → OFF	5 μs (max) 24 V DC 0.2A	
Number of output points		4 points	
Number of common *1		1 points	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *2		12 to 30 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: V and C terminals are separated each output terminal. Refer to Chapter 2 Terminal layout and wiring for more information.

*2: It is necessary to supply 12 to 30 V DC between the V and C terminals externally.

(5) DC output (Y104-Y119 of EH-D64DTPS, Y104-Y115 of EH-D40DTPS, Y104-Y107 of EH-D20DTPS)

Item		Specification	Circuit diagram
Output specification		Transistor output (with short-circuit protection)	
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		10 mA	
Leak current		0.1 mA (max)	
Maximum load current *2	1 circuit	0.7 A	
	1 common	64-point type : 3.0 A 40-point type : 5.0 A 20-point type : 2.8 A	
Output response time	OFF → ON	0.5 ms (max) 24 V DC	
	ON → OFF	0.5 ms (max) 24 V DC	
Number of output points		64-point type : 16 points 40-point type : 12 points 20-point type : 4 points	
Number of common *1		Refer to Chapter 2 Terminal layout and wiring.	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *2		12 to 30 V DC	
Insulation		1500 V or more (external-internal) 500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: V and C terminals are separated each output terminal. Refer to Chapter 2 Terminal layout and wiring for more information.

*2: It is necessary to supply 12 to 30 V DC between the V and C terminals externally.

(6) DC output (Y120-Y123 of EH-D64DTPS)

Item		Specification	Circuit diagram
Output specification		Transistor output (with short-circuit protection)	
Rated load voltage		24/12 V DC (+10 %, -15 %)	
Minimum switching current		10 mA	
Leak current		0.1 mA (max)	
Maximum load current	1 circuit	1.0 A	
	1 common	3.0 A	
Output response time	OFF → ON	0.5 ms (max) 24 V DC	
	ON → OFF	0.5 ms (max) 24 V DC	
Number of output points		4 points	
Number of common *1		1 points	
Surge removing circuit		None	
Fuse		None	
Insulation system		Photocoupler insulation	
Output display		LED (green)	
External connection		Removable type screw terminal block (M3)	
Externally supplied power *2		12 to 30 V DC	
Insulation		1500 V or more (external-internal)	
		500 V or more (external-external)	
Output voltage drop		0.3 V DC (max)	

*1: V and C terminals are separated each output terminal. Refer to Chapter 2 Terminal layout and wiring for more information.

*2: It is necessary to supply 12 to 30 V DC between the V and C terminals externally.

■ Pulse train output / PWM output

Item	20-point/40-point/64-point. type	Transistor output
Available outputs	Y100-Y103 (optional)	
Load voltage	12 / 24 V	
Minimum load current	1 mA	
PWM max. output frequency	65,535 Hz	
Pulse train max. output frequency	65,535 Hz	

* : Please do not use a relay output type as a pulse output.

2.7 Power Supply for Sensor

MICRO20/40/64 can supply current from the 24 V terminal at the input terminal part to the external equipment.

If this terminal is used as the power supply for the input part of this unit, the remaining can be used as power supply for the sensors.

The following current (I) can be supplied as power supply for the sensors.

(1) EH-A64DR / EH-D64DR / EH-D64DT / EH-D64DTPS (64-point type basic unit)

EH-A40DR / EH-D40DR / EH-D40DT / EH-D40DTPS (40-point type basic unit)

EH-A20DR / EH-D20DR / EH-D20DT / EH-D20DTPS (20-point type basic unit)

$$I = 430 \text{ mA} - (5 \text{ mA} \times \text{number of input points that are turned on at the same time}) \\ - (5 \text{ mA} \times \text{number of output points that are turned on at the same time})$$

* Calculate X0, X2, X4, and X6 using 10mA.

2.8 Backup

(1) Lithium battery

The content of the data memory and the clock data can be held with EH-MBATL.

Refer to the following time for the life of battery.

Life of battery (Total power failure time) [Hr] *	
Guaranteed value (MIN) @55°C	Actual value MAX) @25°C
18,000	36,000

The lithium battery can be replace from the front of the PLC.

Please use always EH-MBATL when using the calendar clock.

(2) Condenser

The content of the data memory and the clock data can be held for 24 hours (25°C) with the condenser in the PLC.

2.9 Current Consumption

Model name	Current consumption (A)						Remarks
	100 V AC		264 V AC		24 V DC		
	Normal	Rush	Normal	Rush	Normal	Rush	
EH-A64DR	0.4	15	0.2	40	—	—	
EH-D64DR	—	—	—	—	0.5	2	
EH-D64DT	—	—	—	—	0.4	2	
EH-D64DTPS	—	—	—	—	0.4	2	
EH-A40DR	0.15	15	0.08	40	—	—	
EH-D40DR	—	—	—	—	0.32	2	
EH-D40DT	—	—	—	—	0.24	2	
EH-D40DTPS	—	—	—	—	0.24	2	
EH-A20DR	0.12	15	0.06	40	—	—	
EH-D20DR	—	—	—	—	0.22	2	
EH-D20DT	—	—	—	—	0.18	2	
EH-D20DTPS	—	—	—	—	0.18	2	

2.10 Dimension

(1) 64-point type

Unit : (mm)

(2) 20-point / 40-point type

Chapter 3 Programming

3.1 Memory size and Memory assignment

Table 3.1 lists the programming specifications for the MICRO20/40/64.

Table 3.1 Programming specifications

No.	ITEM		20-point/40-point/64-point type	[Reference] 28-point type
1	Program size		16k steps	3 k steps (3,072 steps)
2	Memory assignment		RAM-16H	RAM-04H
3	Instruction size		32 bits / 1step	
4	Memory specification	SRAM	Backup with optional battery.	
		FLASH	Backup without battery.	
5	Program language		H-series ladder/instruction language	
6	Program creation		Created with H-series programming devices	
7	Program modification	in STOP status	Possible by programming software.	
		in RUN status	Possible (Online change in RUN) by programming software. (except for control commands.)* ¹ (While online change in RUN, PLC operation momentarily stops.).	
7	Off line CPU type		H-302 or MICROEH* ²	H-302 or MICROEH

*1 : Refer to the peripheral unit manual for details.

*2 : If the off-line CPU type is set as "MICROEH" in LADDER EDITOR for Windows ® before Ver.3.05, it becomes impossible to choose RAM-16H. In this case, the off-line CPU type should choose H-302.

Caution

The MICRO20/40/64 backup user programs in the FLASH memory.

In order to shorten the program transfer time, user program is transferred once to the operation execution memory (SRAM), and transfer operation is completed seen from programming software. Then backup copying to FLASH memory starts afterwards. Do not turn off the power to the PLC within approximately two minutes after program downloading. If the power is turned off within two minutes, a user memory error (31H) may occur. Note that the transfer completion to the FLASH memory can be confirmed by the special internal output (R7EF).

In MICRO64, this can be visually checked in OK LED. While FLASH memory is being written, OK LED blinks as follows.

OK LED

3.2 I/O assignment

The I/O assignment and the I/O address of each unit are shown below.

Table 3.2 I/O assignment and I/O address of each unit

Unit		Assignment	20-point/40-point/64-point type	[Reference] 28-point type
Basic	Digital	Slot 0 : X48	X0-39	X0-15
		Slot 1 : Y32	Y100-123	Y100-111
		Slot 2 : Empty	Empty16	Empty16
Exp.1	Digital	Unit 1 / Slot 0 : B1/1	X1000-1003 / 1007 / 1015 (8 / 14 / 16 / 28 pts)	
			Y1016-1019 / 1021 // 1023 / 1027 / 1031 (8 / 14 / 16 / 28 pts)	
	Analog	Unit 1 / Slot 0 : FUN0	WX101-104 (WX100 is used by the system.)	
			WY106-107 (WY105 is used by the system.)	
Exp.2	Digital	Unit 2 / Slot 0 : B1/1	X2000-2003 / 2007 / 2015 (8 / 14 / 16 / 28 pts)	
			Y2016-2019 / 2021 / 2023 / 2027 / 2031 (8 / 14 / 16 / 28 pts)	
	Analog	Unit 2 / Slot 0 : FUN0	WX201-204 (WX200 is used by the system.)	
			WY206-207 (WY205 is used by the system.)	
Exp.3	Digital	Unit 3 / Slot 0 : B1/1	X3000-3003 / 3007 / 3015 (8 / 14 / 16 / 28 pts)	
			Y3016-3019 / 3021 // 3023 / 3027 / 3031 (8 / 14 / 16 / 28 pts)	
	Analog	Unit 3 / Slot 0 : FUN0	WX301-304 (WX300 is used by the system.)	
			WY306-307 (WY305 is used by the system.)	
Exp.4	Digital	Unit 4 / Slot 0 : B1/1	X4000-4003 / 4007 / 4015 (8 / 14 / 16 / 28 pts)	
			Y4016-4019 / 4021 // 4023 / 4027 / 4031 (8 / 14 / 16 / 28 pts)	
	Analog	Unit 4 / Slot 0 : FUN0	WX401-404 (WX400 is used by the system.)	
			WY406-407 (WY405 is used by the system.)	

3.3 Internal output, Edge, Timer

The capacity of an internal output and the number of edge, timers is shown below.

Table 3.3 List of Internal output, Edge, Timer

Function		Sym bol	Size		Name	20-point/40-point/ 64-point type	Ref. 28-point type
						Number of points	Number of points
Internal I/O	Bit	R	B	16	Bit internal output	1,984 points	
		R	B	16	Bit special internal output	64 points	
	Word	WR	W	16	Word internal output	32,768 words	4,096 words
		DR	D	16	Double word internal output		
		WR	W	16	Word special internal output	512 words	
		DR	D	16	Double word special internal output		
	Sharing of bit / word	M	B	16	Bit internal output	16,384 points	
		WM	W	16	Word internal output	1,024 words	
		DM	D	16	Double internal output		
Others	Edge detection	DIF	B	10	Leading edge	512 words	
		DFN	B	10	Trailing edge	512 words	
	Master control	MCS	B	10	Master control set	50 points	
		MCR	B	10	Master control reset		
	Timer, Counter	TD	B	10	On delay timer	Timer + Counter Total 512 points* (Timer is to 256 pts)	Timer + Counter Total 256 points*
		SS	B	10	Single shot timer		
		CU	B	10	Up counter		
		CTU	B	10	Up-down counter up input		
		CTD	B	10	Up-down counter down input		
		CL	B	10	Clear progress value		

* The same timer counter number cannot be used more than once.

Chapter 4 Special I/O

4.1 Introduction

Standard I/O of MICRO-EH can be used as counter input, interruption input, pulse output and a PWM output. In order to use those functions, "operation mode" must be configured at first. In addition to existing mode for the current MICRO-EH, MICRO20/40/64 has new mode of 32-bit counter.

This chapter describes this new additional mode only. (Please refer to a MICRO-EH application manual about other operation modes.)

4.2 Setting of Special I/O

The procedure to switch from standard I/O to either counter input or pulse output is shown below.

[Step 1] Setting of each parameter

1) Set operation mode No. to WRF070. (MICRO20/40/64 addition mode: H20 to 23)

➔ Please refer to "4.3 Operation mode" about operation mode.

2) Set the function of each I/O to WRF071.

➔ Please refer to "4.4 Function setting of I/O terminal" about function of I/O terminal.

3) Set parameters or conditions to WRF1B0 - WRF1C7.

➔ Please refer to "(1) Parameter setting" of each function about detail of condition.

[Step 2] Enable configuration

Set R7F5 to high to enable above configuration.

[Step 3] Control of special I/O

If no error is found in Step2, configuration is completed. Special I/O function is available on user program.

➔ Please refer to "(4) Errors in mode setting" of each function about detail of setting errors.

[Step 4] Save configuration parameters

If necessary, set R7F6 to high to save configuration parameters in FLASH memory. Once parameters are saved in FLASH memory, above configuration is not necessary in the next power ON time.

4.3 Operation mode

In operation modes 20 – 23, each I/O is divided into 4 groups as below, and configured per every group. Both single phase counters and 2-phase counters can be used as 32-bit counter.

Figure 4.1 Overview of special I/O group

Table 4.1 Special I/O operation mode

Mode No. (WRF070)	Input			Output	
	Single-phase counter	2-phase counter	Interrupt	Pulse	PWM
20 H	4 ch	0 ch	4 ch	4 ch	4 ch
21 H	2 ch	1 ch	2 ch	3 ch	3 ch
22 H	2 ch	1 ch	2 ch	3 ch	3 ch
23 H	0 ch	2 ch	0 ch	2 ch	2 ch

* Channel number shown in above table is the maximum number. Channel number that can be used decreases by combination of I/O function.

Example) 2ch. of 2-phase counter : WRF070 → H0023

4.4 Function setting of special I/O

Each I/O function is configured in WRF071 for every group.

WRF071 is divided to 4 groups, and every 4 bits are assigned to every group.

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF071 :	Group 1				Group 2				Group 3				Group 4			
Initial value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Figure 4.2 Special internal output for an I/O functional detailed setup

■ Mode 20

Groups 1-4 choose a function from special I/O(A).

■ Mode 21

Groups 1 choose a function from special I/O(B). Groups 2 choose a function from special I/O(C).

Groups 3,4 choose a function from special I/O(A).

■ Mode 22

Groups 1,2 choose a function from special I/O(A).

Groups 3 choose a function from special I/O(B). Groups 4 choose a function from special I/O(C).

■ Mode 23

Groups 1,3 choose a function from special I/O(B). Groups 2,4 choose a function from special I/O(C).

Refer to the table (Table 4.2 to 4.4) for the setting value of special I/O(A)(B)(C). It inputs into WRF071 combining the setting value of a table. Refer to the next page for Tables 4.2-4.4.

< Note >

Even if the software of Ver.0100 sets up PWM or pulse output in the modes 20-23, it does not operate.

Table 4.2 The function which can be set up, and its setting value in mode 20 - 22

Setting Value	Xn	Xn+1	Ym
0 H	Standard input	Standard input	Standard output
1 H			PWM output "n"
2 H			Pulse output "n"
3 H		Interrupt input	Standard output
4 H			PWM output "n"
5 H	Counter input "n"	Standard input	Pulse output "n"
6 H			Standard output
7 H		Pre-load input "n"	Counter output
8 H			Standard output
9 H			Counter output
A H		Pre-strobe input "n"	Standard output
B H			Counter output
Except the above	Standard input	Standard input	Standard output

n : Group No.

Table 4.3 Function and setting value of group 1,3 in mode 21 - 23

Setting Value	Xn	Xn+1	Ym
0 H	Counter xA	Standard input	Standard output
1 H			Counter output
2 H		Pre-load input x	Standard output
3 H			Counter output
4 H		Pre-strobe input x	Standard output
5 H			Counter output
Except the above	Counter xA	Standard input	Standard output

Table 4.4 Function and setting value of group 2,4 in mode 21 - 23

Setting Value	Xn+2	Xn+3	Ym+1
0 H	Counter xB	Counter xZ	Standard output
1 H			PWM output
2 H			Pulse output
3 H		Standard input	Standard output
4 H			PWM output
5 H			Pulse output
Except the above	Counter xB	Counter xZ	Standard output

■ Setting example 1 (Mode 20)

Group	Function			Table	Value
1	X0 : Standard input	X1 : Standard input	Y100 : Standard output	4.2	→ 0H
2	X2 : Counter input 2	X3 : Pre-load input 2	Y101 : Standard output	4.2	→ 8H
3	X4 : Counter input 3	X5 : Standard input	Y102 : Coincidence output	4.2	→ 7H
4	X6 : Standard input	X7 : Interrupt input	Y103 : Pulse output	4.2	→ 5H

WRF071 → 0875H

■ Setting example 1 (Mode 21)

Group	Function			Table	Value
1	X0 : Counter 1A	X1 : Pre-strobe input	Y100 : Standard output	4.3	→ 4H
2	X2 : Counter 1B	X3 : Counter input 1Z	Y101 : Standard output	4.4	→ 0H
3	X4 : Standard input	X5 : Standard input	Y102 Pulse output	4.2	→ 2H
4	X6 : Standard input	X7 : Interrupt input	Y103 PWM output	4.2	→ 4H

WRF071 → 4024H

4.5 High Speed Counter (HSC)

(1) High speed counter specification

Table 4.5 High speed counter specification

ITEM	Single	2-phase
Number of Channels	Max. 4ch	Max. 2ch
Choice for counter input channels	X0, X2, X4, X6	Use X0 and X2 in pair / Use X4 and X6 in pair
Maximum count frequency	100 kHz	60 kHz
Coincidence output	Able (The disable setting is possible)	
On / Off preset	Able (The disable setting is possible)	
Upper / Lower limit setting	Disable	
Preload / strobe	Able (The disable setting is possible)	

(2) Parameter setting

■ Setting of on-preset

If counter output is used, set counter value that counter output is turned on (the on-preset value). Possible range is from 0 to FFFFFFFFH (0 to 4,294,967,295). If the on-preset value is set as same value as the off-preset value, the counter will not perform any counting operation.

On-preset value of Counter 1 :	WRF1B1 (High word)	WRF1B0 (Low word)
On-preset value of Counter 2 :	WRF1B3 (High word)	WRF1B2 (Low word)
On-preset value of Counter 3 :	WRF1B5 (High word)	WRF1B4 (Low word)
On-preset value of Counter 4 :	WRF1B7 (High word)	WRF1B6 (Low word)

Figure 4.3 Special internal outputs for setting the on-preset values

When counter is not configured, the above special internal outputs are used for other purpose.

■ Setting of off-preset

If counter output is used, set counter value that counter output is turned off (the off-preset value). Possible range is from 0 to FFFFFFFFH (0 to 4,294,967,295). If the off-preset value is set as same value as the on-preset value, the counter will not perform any counting operation.

Off-preset value of Counter 1 :	WRF1B9 (High word)	WRF1B8 (Low word)
Off-preset value of Counter 2 :	WRF1BB (High word)	WRF1BA (Low word)
Off-preset value of Counter 3 :	WRF1BD (High word)	WRF1BC (Low word)
Off-preset value of Counter 4 :	WRF1BF (High word)	WRF1BE (Low word)

Figure 4.4 Special internal outputs for setting the off-preset values

When counter is not configured, the above special internal outputs are used for other purpose.

■ Setting of counter pre-load

If pre-load value is used, set pre-load value. Possible range is from 0 to FFFFFFFFH (0 to 4,294,967,295).

Pre-load value of Counter 1 :	WRF1C1 (High word)	WRF1C0 (Low word)
Pre-load value of Counter 2 :	WRF1C3 (High word)	WRF1C2 (Low word)
Pre-load value of Counter 3 :	WRF1C5 (High word)	WRF1C4 (Low word)
Pre-load value of Counter 4 :	WRF1C7 (High word)	WRF1C6 (Low word)

Figure 4.5 Special internal outputs for setting the pre-load values

When counter is not configured, the above special internal outputs are used for other purpose.

(2) Errors in mode setting

If the on-preset and off-preset values are the same, and flag (R7F5) is activated, error bit shown below will be on, and counter does not work. In addition, the setting error flag (R7F7) turns on.

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF057 :	a	Not used						b	c	d	e	f	g	h	i	

Figure 4.6 Special internal output for setting error indication

Bit	Description of error	Related I/O
a	(Total pulse frequency error)	Y100 to Y103
b	(Pulse 4 frequency error)	Y103
c	(Pulse 3 frequency error)	Y102
d	(Pulse 2 frequency error)	Y101
e	(Pulse 1 frequency error)	Y100
f	Counter 4 preset value error	X6
g	Counter 3 preset value error	X4
h	Counter 2 preset value error	X2
i	Counter 1 preset value error	X0

(3) Control of the counter input by the ladder program

Operation of a counter input is controllable by the ladder program with a FUN command. Moreover, each parameter can be changed.

FUN140	HSC operation control	Start / stop
FUN141	Counter output control	Enable / disable counter output
FUN142	Up / down count setting	Up counter / down counter
FUN143	Write counter value	Write current counter value
FUN144	Read counter value	Read current counter value
FUN145	Clear counter value	Clear counter value
FUN146	Change preset value	Change preset value

* Please refer to "Chapter 8 Additional commands" in the end of this book about the details of the FUN command.

(4) Notes at the time of counter input use

If the pulse of the frequency exceeding specification is inputted, a counter may incorrect-count. When MICRO64 watches a counter value periodically and a counter value changes a lot, it displays that errors occurred on special internal output WRF06A.

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF06A :	Not used												a	b	c	d

Figure 4.7 Special internal output For an incorrect count display in counter

Bit	Description of abnormality	Related terminal
a	Counter 4 counting error	X6
b	Counter 3 counting error	X4
c	Counter 2 counting error	X2
d	Counter 1 counting error	X0

* The above error flag is cleared by setting error clear bit (R7EC) manually or in user program.

4.6 PWM output

(1) PWM output specification

Table 4.6 PWM output specification

ITEM	20 / 40 / 64 pts. type Transistor output
Number of channels	Max. 4ch (Y100-Y103, by user setting)
Load voltage	12 / 24 V
Minimum load current	1 mA
Maximum output frequency	65,535Hz

(2) Parameter setting

■ Setting of output frequency

The output frequency (Hz) of a PWM output is set up. The values which can be set up are 0-FFFFH (0-65,535).

*Please be sure to set H0000 to High-WORD.

Output frequency of PWM output 1 :	WRF1B1(Not used H0000)	WRF1B0 (Output frequency)
Output frequency of PWM output 2 :	WRF1B3(Not used H0000)	WRF1B2 (Output frequency)
Output frequency of PWM output 3 :	WRF1B5(Not used H0000)	WRF1B4 (Output frequency)
Output frequency of PWM output 4 :	WRF1B7(Not used H0000)	WRF1B6 (Output frequency)

Figure 4.8 Special Internal output for an output frequency setup

The above-mentioned special internal output is used as a parameter of another purpose by setup of those other than a PWM output.

■ Setting of ON-duty

ON-duty (The rate of ON time: %) of a PWM output is set up. The values which can be set up are 0-64H (0-100).

If the value more than 64H (100) is set up, it will operate by 100.

ON-duty of PWM output 1 :	WRF1B9 (Not used H0000)	WRF1B8 (ON-duty)
ON-duty of PWM output 2 :	WRF1BB (Not used H0000)	WRF1BA (ON-duty)
ON-duty of PWM output 3 :	WRF1BD (Not used H0000)	WRF1BC (ON-duty)
ON-duty of PWM output 4 :	WRF1BF (Not used H0000)	WRF1BE (ON-duty)

Figure 4.9 Special Internal output for an ON-duty setup

The above-mentioned special internal output is used as a parameter of another purpose by setup of those other than a PWM output.

(3) Errors in mode setting

PWM output does not have the abnormalities in a parameter.

When output frequency is set as 0Hz, a system sets output frequency as 10Hz.

(4) Control of the PWM output by the ladder program

Operation of a PWM output is controllable by FUN command. Moreover, each parameter can be changed.

FUN147 PWM operation control A start/stop of a PWM output are executed.

FUN148 Frequency/ON-duty changes The parameter of the specified PWM output is changed.

The FUN command about a PWM output is not to change / addition. For details, please refer to a MICRO-EH application manual.

4.7 Pulse train output

In operation modes 20 – 23, the output pulse-number can be set up by 32 bits (0~4,294,967,295).

Moreover, a maximum output frequency is 65,535Hz.

(1) Pulse train output specification

Table 4.7 Pulse output specification

ITEM	20 / 40 / 64 pts. type Transistor output
Number of channels	Max. 4ch (Y100-Y103, by user setting)
Load voltage	12 / 24 V
Minimum load current	1 mA
Maximum output frequency	65,535Hz
Maximum number of pulse output	4,294,967,295

(2) Parameter setting

■ Setting of output frequency

Output frequency is set as the pulse output to be used. The values which can be set up are 0-FFFFH(0-65,535).

*Please be sure to set H0000 to high word in operation modes 20 – 23.

Output frequency of Pulse output 1 :	WRF1B1(Not used H0000)	WRF1B0 (Output frequency)
Output frequency of Pulse output 2 :	WRF1B3(Not used H0000)	WRF1B2 (Output frequency)
Output frequency of Pulse output 3 :	WRF1B5(Not used H0000)	WRF1B4 (Output frequency)
Output frequency of Pulse output 4 :	WRF1B7(Not used H0000)	WRF1B6 (Output frequency)

Figure 4.10 Special Internal output for an Output frequency setup

The above-mentioned special internal output is used as a parameter of another purpose by setup of those other than a pulse train output.

■ Setting of Pulse output

Output pulse-number is set as the pulse output to be used. The values which can be set up are 0-FFFFFFFFH(0-4,294,967,295).

Output pulse-number of Pulse output 1 :	WRF1C1 (high data)	WRF1C0 (low data)
Output pulse-number of Pulse output 2 :	WRF1C3 (high data)	WRF1C2 (low data)
Output pulse-number of Pulse output 3 :	WRF1C5 (high data)	WRF1C4 (low data)
Output pulse-number of Pulse output 4 :	WRF1C7 (high data)	WRF1C6 (low data)

Figure 4.11 Special Internal output for an Pulse output setup

The above-mentioned special internal output is used as a parameter of another purpose by setup of those other than a pulse train output.

(3) Errors in mode setting

Pulse output does not have the abnormalities in a parameter.

When output frequency is set as 0Hz, a system sets output frequency as 10Hz..

(3) Control of the pulse output by the ladder program

Operation of a pulse output is controllable by FUN command. Moreover, each parameter can be changed.

FUN149 Pulse output control

Pulse output control

FUN150 Pulse frequency setting changes

Pulse frequency output setting changes

FUN151 Pulse output with acceleration/deceleration

Frequency is changed by a start and stop of a pulse output.

FUN153 Pulse output with sequence parameter change

The frequency of a pulse output is changed arbitrarily.

* Please refer to "Chapter 8 Additional commands" in the end of this book about the details of the FUN command.

(4) Notes at the time of pulse output use

A pulse output requires load for system processing. Therefore, while outputting the pulse, command processing time is extended 1.4 times at the maximum. (It is large effect, so that output frequency is high.)

Example) 4ch All pulse outputs are outputted by 65kHz. Scan time 20ms → 28ms

Chapter 5 Communication port

MICRO20/40/64 has one RS-232C port. This port can be used as a dedicated port or a general-purpose port. In addition, it has modem control function which communicates from a remote place through a modem.

5.1 Dedicated port

The specification of communication port is shown in table 5.1.

The communication port can be connected with the peripheral unit that supports a H-Protocol. (Portable diagram programming tool and instruction language programming tool cannot be used.) By connecting this port with a peripheral unit, created user programs can be transferred, user programs stored in the CPU can be read/verified, and the CPU operating status can be monitored. In addition, remote monitoring system can be built up by HMI ,etc.

Modem function is available in this port also. Please refer to the application manual of MICRO-EH for further information.

Table 5.1 Communication port specification

Item	Specification
Transmission speed	When peripheral units are connected
	4800 bps, 9600 bps, 19.2 kbps, 38.4 kbps
	Modem mode
	2400 bps, 4800 bps, 9600 bps, 19.2 kbps, 38.4 kbps, 57.6 kbps
	SW1 SW3 Transmission speed setting
	ON ON 38.4 kbps ON OFF 19.2 kbps OFF ON 9600 bps OFF OFF 4800 bps
Communication system	Half duplex
Synchronization system	Start-stop synchronization
Startup system	One-sided startup using the host side command
Transmission system	Serial transmission (bit serial transmission)
Transmission code	ASCII
Transmission code configuration	<p>Start bit (1bit) Parity bit (1bit) Stop bit (1bit)</p> <p>2⁰ 2¹ 2² 2³ 2⁴ 2⁵ 2⁶ P</p> <p>Data (7 bits, Even parity)</p>
Transmission code outgoing sequence	Sent out from the lowest bit in character units
Error control	Vertical parity check, checksum, overrun check, framing check
Transmission unit	Message unit (variable length)
Maximum message length	503 bytes (including control characters)
Interface	Conforms to RS-232C (maximum cable length: 15 m)
Control procedure	H-series dedicated procedure (H-Protocol) Standard procedure (transmission control procedure 1), Simplified procedure (transmission control procedure 2)
Connector used	CPU side: 8-pin modular connector (RJ-45)

■ Note

- Portable diagram programming tool and instruction language programming tool cannot be used.
- Please note that if DIP switch 1 is set to On, +12V is output from pin 4.
- If the negative acknowledge command (NAK) is sent from the host using the transmission control procedure 1 or 2, wait at least 10 ms before sending the next text.
- Specify a value of 20 ms or higher for the response TM of the H-protocol. (When the response TM is set to 0, the default value of 20 ms will be used.)

(1) Port settings

Port can be set when the DR signal of port is off. The setting becomes valid when the DR signal is turned on.

1] Setting the DIP switches

Remove the serial port cover on the front case and set the DIP switches according to the below table.

Table 5.2 Setting of DIP SW

SW No.	1	2	3	4	Setting	Remarks
DIPSW	ON	OFF	ON	OFF	38.4 kbps	
	ON	OFF	OFF	OFF	19.2 kbps	Default
	OFF	OFF	ON	OFF	9600 bps	
	OFF	OFF	OFF	OFF	4800 bps	
	OFF	ON	OFF	OFF	Connection via modem	

(do not set SW4 to ON; it is fixed to OFF.)

2] Setting the special internal output

If necessary, set the transmission control procedure and transmission speed in case of modem mode in special internal output WRF01A.

Values in this special internal output is stored in the FLASH memory by setting various setting write request (R7F6) On. Once stored in the FLASH memory, it is not necessary to make the setting again when the power supply is turned on next time.

Note

If transmission control procedure 2 is set for port 1 and the special internal output setting is stored in the FLASH memory by R7F6, port 1 starts up with transmission control procedure 2 when the power is turned on next time. Thus, note that the peripheral units that only support transmission control procedure 1 will not be connected.

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF01A :	a	Not used		b				Not used								
Initial value :	0	0		0	0	0	0									

Figure 5.1 Special internal output for setting port

Area	Setting Value	Content	Remarks
a	0	Transmission control procedure 1	H0***
	1	Transmission control procedure 2	H8***
b	0	Transmission speed 4800 bps	Setting of bits 8 to 12 00000 (H*0**)
	1	when connecting via modem 9600 bps	00001 (H*1**)
	2	19.2 kbps	00010 (H*2**)
	3	38.4 kbps	00011 (H*3**)
	4	57.6 kbps	00100 (H*4**)
	5	2400 bps	00101 (H*5**)
	Other than above	4800 bps	

(2) Port hardware

The circuit diagram of port and the signal list are shown in Figure 5.2 and Table 5.3 respectively.

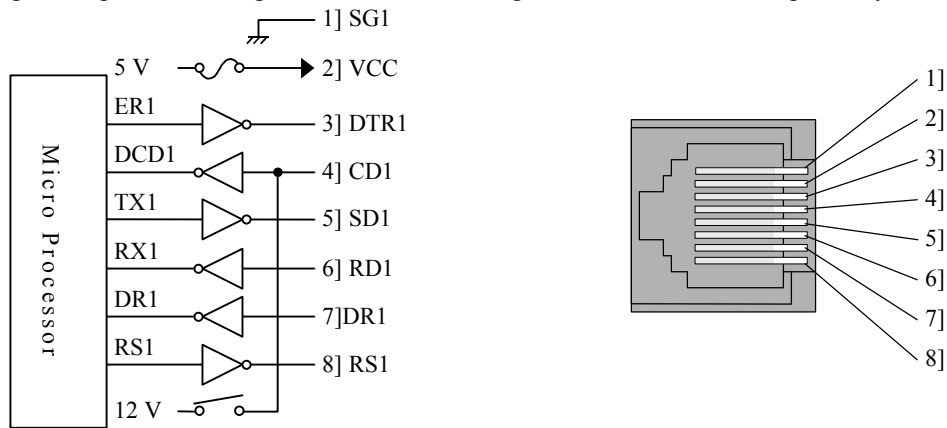

Figure 5.2 Circuit diagram and pin numbers for port

Table 5.3 List of port 1 signals

Pin No.	Signal abbreviation	Direction		Meaning
		CPU	HOST	
1]	SG1	←→		Ground for signals
2]	VCC	→		5 V DC is supplied. (Protective fuse is connected.)
3]	DTR1(ER)	→		Communication enabled signal When this signal is high level, communication is possible.
4]	CD1(DCD)	→		12V is output when DIP switch 1 is turned On.
5]	SD1(TXD)	→		Data sent by the CPU
6]	RD1(RXD)	→		Data received by the CPU
7]	DR1(DSR)	←		Peripheral units connected signal When this signal is high level, indicates that dedicated peripherals are connected.
8]	RS1(RTS)	←		Transmission request signal When this signal is high level, indicates that the CPU can receive data.

5.2 General-purpose port

The communication port can be switched to general-purpose port by command. (General-purpose port works only in RUN status.)

General purpose port is switched by special FUN command (FUN 5) in user program. Communication on the general-purpose port is operated by communication command (TRNS 0) in user program.

Table 5.4 Communication port specifications (general-purpose port)

Item	Specification											
Transmission speed	Specifies by TRNS 0 / RECV 0 : 4800 bps, 9600 bps, 19.2 kbps, 38.4 kbps, 57.6 kbps											
Communication system	Half duplex											
Synchronization system	Start-stop synchronization											
Transmission system	Serial transmission (bit serial transmission)											
Transmission code configuration	<div>Specifies by TRNS 0 / RECV 0</div> <div>Transmission data (7 or 8)</div> <div><table><tr><td>a</td><td>2⁰</td><td>2¹</td><td>2²</td><td>2³</td><td>2⁴</td><td>2⁵</td><td>2⁶</td><td>2⁷</td><td>b</td><td>c</td></tr></table></div> <div>a : Start bit</div> <div>b : Parity bit (Even / Odd / None)</div> <div>c : Stop bit (1 or 2)</div>	a	2 ⁰	2 ¹	2 ²	2 ³	2 ⁴	2 ⁵	2 ⁶	2 ⁷	b	c
a	2 ⁰	2 ¹	2 ²	2 ³	2 ⁴	2 ⁵	2 ⁶	2 ⁷	b	c		
Error control	Vertical parity check, overrun check, framing check											
Transmission format	<div>1] Start character & Receiving data length</div> <div>2] Start character & Stop character</div> <div>3] Stop character</div> <div>4] Receiving data length</div> <div>Specification by the format of 1] - 4] is possible.</div>											
Sending buffer	1,024 bytes											
Receiving buffer	1,024 bytes											

Note

In order to use a communication port as a general-purpose port (TRNS 0 / RECV 0 is performed), it is necessary to execute FUN 5 (general-purpose port change command) first.

Please refer to a MICRO-EH application manual about the details of TRNS 0 / RECV 0 / FUN 5.

Chapter 6 Special internal output

6.1 Special internal output (bit)

New added or changed special internal output (bit) for MICRO20/40/64 is shown in the following table.

* The other special internal output is the same as existing MICRO-EH.

Table 6.1 Special internal output (Bit) list (add / change)

No.	Name	Meaning	Description	Setting condition	Resetting condition
R7CA	Retentive area error	0: Normal 1: Error	When retentive area is undefined status, this bit is activated.	Set by the system	Cleared by user
R7CB	Processor error	0: Normal 1: Error	When micro processor is in error, this bit is activated.		
R7D8	Clock error	0: Normal 1: Error	When clock IC is in error, this bit is activated.		
R7DF	Option board error	0: Supported 1: Not supported	When unsupported option board is mounted, this bit is activated.		

■Reference Special internal output (bit) list

No.	Name
R7C0	Ignore scan time error (normal scan)
R7C1	Ignore scan time error (periodic scan)
R7C2	Ignore scan time error (interrupt scan)

Chapter 7 Error code

The error code added by MICRO20/40/64 is shown in the following table.

Table 7.1 Additional error code details

Error Code	Error name [detection timing]	Classification	Description	RUN LED	OK LED	Operation	Related special internal output	
							Bit	Word
2B	Processor error [when power is turned on]	Serious error	The abnormalities of the processor for I/O control were detected.			Stops	R7CB	-
5E	Option board error [Always checking]	Warning	Unsupported option board is mounted.	-		Runs	R7DF	-
75	Memory board error [when power is turned on]	Warning	Data failure in memory board.	-		Runs	-	WRF062
76	Power failure memory area error [when power is turned on]	Warning	The area specified to be power failure memory is unfixed by the low battery.	-		Runs	R7CA	-

 : ON  : OFF  : Flashing (1 s ON, 1 s OFF)  : Flashing (500 ms ON, 500 ms OFF)

 : Flashing (250 ms ON, 250 ms OFF)

- : Depends on the CPU's operating state. The RUN LED is lit while the CPU is in operation; the RUN LED is unlit while the CPU is not in operation.

■ Error code list

Table 7.2 Error code list (1/2)

Error Code	Error name [detection timing]	Classification	Description
11	System ROM error [when power is turned on]	Fatal error	The system ROM has a checksum error or cannot be read (Error in built-in ROM/FLASH)
12	System RAM error [when power is turned on]	Fatal error	The system RAM cannot be read and/or written properly
13	Micro computer error [always checking]	Fatal error	Address error interrupt, undefined instruction interrupt occurred in the micro computer
1F	System program error [always checking]	Fatal error	System program in FLASH memory has a checksum error
23	Undefined instruction [when starting RUN]	Serious error	Error is detected when an attempt is made to execute a user program instruction that cannot be decoded (undefined instruction)
27	Data memory error [when power ON, when initializing CPU]	Serious error	Data memory cannot be read/written properly.
31	User memory error [when power is turned on, when RUN starts, during RUN]	Serious error	A checksum error is detected in user memory.
33	User memory size error [when RUN starts]	Serious error	User program capacity set by the parameter is other than 280 HEX.
34	Grammar/assemble error [when RUN starts, when changing during RUN]	Serious error	There is a grammatical error in the user program.
41	I/O information verification error [always checking]	Minor error	I/O assignment information and actual loading of module do not match
44	Overload error (normal scan) [during END processing]	Minor error	Execution time for normal scan exceeded the overload check time set by the parameter.
45	Overload error (periodical scan) [periodical processing]	Minor error	Execution time for periodical scan exceeded the execution period.
46	Overload error (interrupt scan) [during interrupt processing]	Minor error	An interrupt of the same cause occurred during interrupt scan
5F	Backup memory error [when program writing is executed, when PI/O function setting is requested]	Warning	Data cannot be written to the backup memory.

Table 7.3 Error code list (2/2)

Error Code	Error name [detection timing]	Classification	Description
61	Port 1 transmission error (parity) [when transmitting]	Warning	A parity error was detected during transmission.
62	Port 1 transmission error (framing/overflow) [when transmitting]	Warning	A framing error or overflow error was detected during transmission.
63	Port 1 transmission error (time out) [when transmitting]	Warning	A time out error was detected during transmission.
64	Port 1 transmission error (protocol error) [when transmitting]	Warning	A protocol (transmission procedure) error was detected during transmission.
65	Port 1 transmission error (BCC error) [when transmitting]	Warning	A checksum error was detected during transmission.
67	Port 2 transmission error (parity) [when transmitting]	Warning	A parity error was detected during transmission.
68	Port 2 transmission error (framing/overflow) [when transmitting]	Warning	A framing error or overflow error was detected during transmission.
69	Port 2 transmission error (time out) [when transmitting]	Warning	A time out error was detected during transmission.
6A	Port 2 transmission error (protocol error) [when transmitting]	Warning	A protocol (transmission procedure) error was detected during transmission.
6B	Port 2 transmission error (BCC error) [when transmitting]	Warning	A checksum error was detected during transmission.
71	Battery error (data memory) [always checking]	Warning	<ul style="list-style-type: none"> • Battery voltage dropped below the specified value • Battery not installed
94	Port 1 No modem response [when modem is connected]	Warning	There is no response with the AT command.

Chapter 8 Additional commands

One application command and 53 FUN commands have been added to MICRO20/40/64. In addition, since the counter input and number of output pulse is extended to 32-bit, the counter input control and pulse output control command is applied to 32-bit.

This chapter describes the specification of a command added / changed.

8.1 Additional command list

(1) Application command

Table 8.1 Additional command list (Application command)

No.	Ladder symbol	Command name	Process descriptions
1	ADRIO(d, s)	I/O address conversion	Stores the actual address of the I/O designated by s in d.

(2) FUN command

Table 8.2 Additional command list (FUN command) 1/2

No.	Ladder symbol	Command name	Process descriptions
1	FUN 0(s) [PIDIT(s)]	PID operation initialization	Initializes the area for PID operation.
2	FUN 1(s) [PIDOP(s)]	PID operation execution control	Performs control for PID operation execution.
3	FUN 2(s) [PIDCL(s)]	PID operation calculation	Executes PID operation.
4	FUN 4 (s) [IFR (s)]	Process stepping	Performs the process stepping processing.
5	FUN 10 (s) [SIN (s)]	SIN function	Calculates the SIN of the value designated by s and stores the result in s+1, s+2.
6	FUN 11 (s) [COS (s)]	COS function	Calculates the COS of the value designated by s and stores the result in s+1, s+2.
7	FUN 12 (s) [TAN (s)]	TAN function	Calculates the TAN of the value designated by s and stores the result in s+1, s+2.
8	FUN 13 (s) [ASIN (s)]	ARC SIN function	Calculates the ARC SIN of the value designated by s (fractional portion) and s+1 (integer portion), and stores the result in s+2.
9	FUN 14 (s) [ACOS (s)]	ARC COS function	Calculates the ARC COS of the value designated by s (fractional portion) and s+1 (integer portion), and stores the results in s+2.
10	FUN 15 (s) [ATAN (s)]	ARC TAN function	Calculates the ARC TAN of the value designated by s (fractional portion) and s+1 (integer portion), and stores the results in s+2.
11	FUN22 (s)	Check code calculation	Check code for sending serial communication message is calculated and created.
12	FUN23 (s)	Check code verifying	Check code for receiving serial communication message is verified.
13	FUN 30 (s) [BINDA (s)]	BIN → ASCII conversion (16 bits)	Converts 16-bit unsigned binary data to a decimal ASCII code, then stores it.
14	FUN 31 (s) [DBINDA (s)]	BIN → ASCII conversion (32 bits)	Converts 32-bit unsigned binary data to a decimal ASCII code, then stores it.
15	FUN 32 (s) [BINHA (s)]	BIN → ASCII conversion (16 bits)	Converts 16-bit unsigned binary data to an ASCII code, then stores it.
16	FUN 33 (s) [DBINHA (s)]	BIN → ASCII conversion (32 bits)	Converts 32-bit unsigned binary data to an ASCII code, then stores it.
17	FUN 34 (s) [BCDDA (s)]	BIN → ASCII conversion (16 bits)	Converts 16-bit BCD (BCD 4-digit) data to an ASCII code, then stores it.
18	FUN 35 (s) [DBCDDA (s)]	BIN → ASCII conversion (32 bits)	Converts 32-bit BCD (BCD 8-digit) data to an ASCII code, then stores it.
19	FUN 36 (s) [DABIN (s)]	ASCII → BIN conversion (16 bits)	Converts unsigned BCD 5-digit data to an ASCII code, then stores it.
20	FUN 37 (s) [DDABIN (s)]	ASCII → BIN conversion (32 bits)	Converts signed BCD 10-digit data to an ASCII code, then stores it.
21	FUN 38 (s) [HABIN (s)]	ASCII → BIN conversion (16 bits)	Converts a 4-digit hexadecimal ASCII code to 16-bit binary data, then stores it.
22	FUN 39 (s) [DHABIN (s)]	ASCII → BIN conversion (32 bits)	Converts a 8-digit hexadecimal ASCII code to 32-bit binary data, then stores it.
23	FUN 40 (s) [DABCD (s)]	ASCII → BIN conversion (16 bits)	Converts a 4-digit ASCII code to 4-digit BCD data, then stores it.
24	FUN 41 (s) [DDABCD (s)]	ASCII → BIN conversion (32 bits)	Converts a 8-digit ASCII code to 8-digit BCD data, then stores it.
25	FUN 42 (s) [ASC (s)]	BIN → ASCII conversion (designated)	Converts binary data to an ASCII code of the designated number of characters, then stores it.
26	FUN 43 (s) [HEX (s)]	ASCII → BIN conversion (designated)	Converts an ASCII code of the designated number of characters to binary data, then stores it.
27	FUN 44 (s) [SADD (s)]	Merge character strings	Merges the designated character strings (up to NULL), then stores it in the I/O at the designated position.
28	FUN 45 (s) [SCMP (s)]	Compare character strings	Compares the designated character strings (up to NULL), then stores the comparison result.
29	FUN 46 (s) [WTOB (s)]	Word → byte conversion	Divides 16-bit word data, converts it to 8-bit byte data, then stores it.
30	FUN 47 (s) [BTOW (s)]	Byte → word conversion	Divides 8-bit byte data, merges it into 16-bit word data, then stores it.
31	FUN 48 (s) [BSHR (s)]	Right-shift byte unit	Shifts the designated data string to the right for the number of the designated bytes (8 bits*n).
32	FUN 49 (s) [BSHL (s)]	Left-shift byte unit	Shifts the designated data string to the left for the number of the designated bytes (8 bits*n).

*[] indicates the display when the LADDER EDITOR is used.

Table 8.3 Additional command list (FUN command) 2/2

No.	Ladder symbol	Command name	Process descriptions
33	FUN 100(s) [INTW(s)]	Floating point operation (Real number to integer)	Real number to integer (Word) conversion.
34	FUN 101(s) [INTD(s)]	Floating point operation (Real number to integer)	Real number to integer (Double word) conversion.
35	FUN 102(s) [FLOAT(s)]	Floating point operation (Integer to real number)	Integer (word) to real number conversion.
36	FUN 103(s) [FLOATD(s)]	Floating point operation (Integer to real number)	Integer (Double word) to real number conversion.
37	FUN 104(s) [FADD(s)]	Floating point operation (Addition)	The addition of the real number.
38	FUN 105(s) [FSUB(s)]	Floating point operation (Subtraction)	The subtraction of the real number.
39	FUN 106(s) [FMUL(s)]	Floating point operation (Multiplication)	The multiplication of the real number.
40	FUN 107(s) [FDIV(s)]	Floating point operation (Division)	The division of the real number.
41	FUN 108(s) [FRAD(s)]	Floating point operation (Radian conversion)	Angle to radian conversion.
42	FUN 109(s) [FDEG(s)]	Floating point operation (Angle conversion)	Radian to angle conversion.
43	FUN 110(s) [FSIN(s)]	Floating point operation (SIN)	Calculates the SIN of the floating point number.
44	FUN 111(s) [FCOS(s)]	Floating point operation (COS)	Calculates the COS of the floating point number.
45	FUN 112(s) [FTAN(s)]	Floating point operation (TAN)	Calculates the TAN of the floating point number.
46	FUN 113(s) [FASIN(s)]	Floating point operation (ARC SIN)	Calculates the ARC SIN of the floating point number.
47	FUN 114(s) [FACOS(s)]	Floating point operation (ARC COS)	Calculates the ARC COS of the floating point number.
48	FUN 115(s) [FATAN(s)]	Floating point operation (ARC TAN)	Calculates the ARC TAN of the floating point number.
49	FUN 116(s) [FSQR(s)]	Floating point operation (Square root)	Calculates the square root of the floating point number.
50	FUN 117(s) [FEXP(s)]	Floating point operation (Exponent)	Calculates the exponent of the floating point number.
51	FUN 118(s) [FLOG(s)]	Floating point operation (Logarithm)	Calculates the logarithm of the floating point number.
52	FUN 119(s)	Floating point operation (Common logarithm)	Calculates the common logarithm of the floating point number.
53	FUN 153(s)	Pulse output with sequence parameter change	Pulse output according to the parameter beforehand registered into the table.

*[] indicates the display when the LADDER EDITOR is used.

 : Supported by software ver. 1.01 or later

8.2 Changed command list

Table 8.4 Changed command list

No.	Ladder symbol	Command name	Process descriptions
1	FUN 143 (s)	HSC Counter value rewrite	The count value of the specified counter is rewritten.
2	FUN 144 (s)	HSC Counter value re	The present value of the specified counter is read.
3	FUN 146 (s)	HSC Preset value change	The preset value of the specified counter is changed.
4	FUN 150 (s)	Pulse frequency output setting changes	The frequency / number of output pulse of the specified counter is changed.
5	FUN 151 (s)	Pulse output with acceleration / deceleration	A pulse is outputted increasing / decreasing frequency.

 : Changed by software ver. 1.01 or later

8.3 Command specifications

Please refer to the command specification from the following page about the details of a command added or changed.

Name		I/O address conversion														
Ladder format				Condition code						Processing time (μs)				Remark		
ADRIO (d, s)				R7F4	R7F3	R7F2	R7F1	R7F0	Ave	Max			Upper case: B Lower case: W			
				DER	ERR	SD	V	C	26.5	←						
				●	●	●	●	●								
Command format				Number of steps						26.5	←					
ADRIO (d, s)				Condition			Steps									
				—			3									
Usable I/O			Bit				Word				Double word			Constant	Other	
			X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM			
d	Conversion address								○	○						
s	I/O to be converted			○	○	○		○	○	○						
Function																
Obtains the actual address of the I/O designated by s, and sets the result in d.																
Program example																
<div><div><div>X20</div><div>DIF0</div><div><div><div></div><div></div><div></div><div></div><div></div></div><div></div></div><div>ADRIO (WR100, WR0)</div><div></div></div><div><div>LD</div><div>X200</div><div>AND</div><div>DIF0</div><div>[</div><div>ADRIO (WR100, WR0)</div><div>]</div></div></div>																
Program description																
Upon X00020 rise, the actual address of WR0000 (H3C00) is set in WR0100. After command execution, WR0100 becomes H3C00.																

Name		PID Initialization														
Ladder format				Condition code						Processing time (μs)				Remark		
FUN 0 (s) * [PIDIT (s)]				R7F4	R7F3	R7F2	R7F1	R7F0	Ave	Max			4,115 6,502			
				DER	ERR	SD	V	C								
				●	●	●	●	●								
Command format				Number of steps												
FUN 0 (s) * [PIDIT (s)]				Condition				Steps								
				—				3								
Usable I/O				Bit				Word				Double word			Constant	Other
				X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM		
s	PID control table								○						WR only	
Function																
<div><div></div><div><ul style="list-style-type: none">The FUN 0 (s) initializes the area in which the initialization set data required for PID operation is stored.The (s) in the FUN 0 (s) is used to specify the head number of WR of the PID management table.If there is an error in the contents specified in the PID control table, an error code will be set in error code 0 of the PID control table and initialization will not be performed.Once initialization is successfully completed (FUN 0 normal completion (“1”) in the PID management table), re-executing the FUN 0 will generate an error.</div></div>																
Cautionary notes																
If difficulty arises when the area used by the PID operation is cleared upon operation start or recovering from a power failure, please specify the power failure memory.																

* [] indicates the display when the LADDER EDITOR is used.

Name		PID operation control															
Ladder format					Condition code					Processing time (μs)				Remark			
FUN 1 (s) * [PIDOP (s)]					R7F4	R7F3	R7F2	R7F1	R7F0	Ave.	Max.						
					DER	ERR	SD	V	C	118			195				
					●	●	●	●	●								
Command format					Number of steps												
FUN 1 (s) * [PIDOP (s)]					Condition				Steps								
					—				3								
Usable I/O				Bit				Word				Double word			Constant	Other	
				X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM			
s	PID control table									○						WR only	
Function																	
<div><ul style="list-style-type: none">• The FUN 1 (s) determines the loop in which the operation is performed after reading the PID Execution flag from the bit table area of the loop and the PID Constant Change flag.• Set (s) in the FUN 1 (s) as the head number of the PID control table. If set differently, an error will be generated and an error code will be set to error codes 0 and 1 of the PID control table, resulting in the FUN 1 not being executed.• Program the FUN 1 (s) so that it is executed once during the 20 ms periodic scanning.</div>																	

* [] indicates the display when the LADDER EDITOR is used.

Name		PID calculation process															
Ladder format				Condition code						Processing time (μs)			Remark				
FUN 2 (s) * [PIDCL (s)]				R7F4	R7F3	R7F2	R7F1	R7F0	Ave.	Max.	147 ←						
				DER	ERR	SD	V	C									
				●	●	●	●	●

			X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY	DR, DM				
s	Word table								○						WR only		
Function																	
<ul style="list-style-type: none">• The sampling time set in the word table for each loop determines whether or not PID calculation is performed.• The FUN 2 (s) turns ON the PID Calculation In Progress flag of the loop that is being calculated.• The FUN 2 (s) will check for the output upper limit and low limit values, set value bit pattern, and range of the output value bit pattern for each loop. If an error is generated, the FUN 2 Error flag of the loop bit table will turn ON and an error code is set to error code 2 of the PID control table. The FUN 2 will be executed even if an error is generated.																	
Cautionary notes																	
<ul style="list-style-type: none">• Set all of the head number of WR of the word table for each PID loop of the FUN 2 (s).• Program the FUN 2 (s) so that it is executed during the 20 ms periodic scanning.																	

* [] indicates the display when the LADDER EDITOR is used.

(1) PID control table (In the case of FUN 0 (WRxxxx))

(a) Structure of PID management table (1)

Sets the header number of the WR used as the PID control table in s of FUN 0 (s). The PID control table is comprised of 2], 3], 4] and 5], and the size of the table increases by the number of loops 3]. Make sure that the maximum number of the WR is not exceeded. Otherwise, error code H0004 will be written in error code 0 2].

Address	Contents	Details	Remarks
xxxx	Error code 0 *1 (Read)	<ul style="list-style-type: none"> Sets the error code generated by FUN 0 processing or some part of FUN 1 processing. If no error is present, the prior status is maintained. 	2]
xxxx + 1	Error code 1 *1 (Read)	<ul style="list-style-type: none"> Sets the error code generated by FUN 1 processing. If no error is present, the prior status is maintained. 	
xxxx + 2	Error code 2 *1 (Read)	<ul style="list-style-type: none"> Sets the error code generated by FUN 2 processing. If no error is present, the prior status is maintained. 	
xxxx + 3	FUN 0 Normal completion 1 (Read)	<ul style="list-style-type: none"> Sets H0001 when FUN 0 (PID initialization) is executed normally. If an error is generated, the value will be H0000, and an error code will be set in error code 0. 	5]
xxxx + 4	Number of loops (Write) *2	<ul style="list-style-type: none"> Sets the number of loops used in a range between 1 and 64. If the value is 0, H0002 is written in error code 0, and the PID will not be processed. (Even if the FUN 1 and FUN 2 are programmed, PID will not be processed.) 	3]
xxxx + 5	Head address of the WR of the word table for loop 1 (Write) *2	<ul style="list-style-type: none"> 48 words are used per loop for PID constant input and for PID internal calculations. If the maximum WR number is exceeded, error code XX05 will be written in error code 0. 	4]
xxxx + 6	Head address of the WR of the word table for loop 2 (Write) *2	<ul style="list-style-type: none"> 48 words are used per loop for PID constant input and for PID internal calculations. If the maximum WR number is exceeded, error code XX05 will be written in error code 0. 	
xxxx + 7	Head address of the WR of the word table for loop 3 (Write) *2	<ul style="list-style-type: none"> 48 words are used per loop for PID constant input and for PID internal calculations. If the maximum WR number is exceeded, error code XX05 will be written in error code 0. 	
...	
xxxx + 44	Head address of the WR of the word table for loop 64 (Write)*2	<ul style="list-style-type: none"> 48 words are used per loop for PID constant input and for PID internal calculations. If the maximum WR number is exceeded, error code XX05 will be written in error code 0. 	

*1 Error codes are expressed as a four-digit hexadecimal value. For more information, see the Error Code Details.

*2 The (Write) in the above table indicates the areas where the user enters data using a program. (It is also possible to read data.)

(b) Word table and bit table for each loop

[If the content of xxxx+5 in (a) is ADRIO (xxxx+5, yyyy)]

Address	Contents	Specifications	Notes	Remarks
yyyy	ADRIO (yyyy, zzzz) zzzz is the header number of the bit internal output.	Sets the header address of the bit table.	Uses 16 bits per loop. Set the actual address of the header number using the ADRIO command so the last suffix of the bit internal output is not exceeded.	11]
yyyy + 1	Sampling time TZ	When 1 to 200 (× 20 ms) analog I/O is installed in a basic base or extended base.	<ul style="list-style-type: none"> • Set a multiple of the minimum set value. • The minimum set value is the value set to the number of loops 3]. 	12]
yyyy + 2	Proportional gain KP	− 1,000 to +1,000	Corresponds to -10.00 to +10.00.	13]
yyyy + 3	Integral content Ti/TZ	1 to 32,767	Value is set to Ti/(Sampling time x 20 ms)	14]
yyyy + 4	Derivative constant TD/TZ	1 to 32,767	Value is set to Ti/(Sampling time x 20 ms)	15]
yyyy + 5	Derivative delay constant Tn/TZ	1 to 32,767	Value is set to Ti/(Sampling time x 20 ms)	16]
yyyy + 6	Output upper limit value UL	− 32,767 to 32,767	The following condition must be met. $LL \leq INIT \leq UL$	17]
yyyy + 7	Output low limit value LL	− 32,767 to 32,767		18]
yyyy + 8	Initial value INIT	− 32,767 to 32,767		19]
yyyy + 9	Set value I/O number (Write)	Set the actual address of the word number of the I/O for which the set value is set.		20]
yyyy + A	Measured Value I/O number (Write)	Set the actual address of the word number of the I/O for which the measured value is set.		21]
yyyy + B	Output value I/O Number (Write)	Set the actual address of the word number of the I/O that outputs the PID calculation results.		22]
yyyy + C	Set value bit pattern (Write)	Determine the method that is used to convert the set value to the 16-bit data in which the PID operation is performed. See *3 below and use a value between H0001 and H0004.		23]
yyyy + D	Measured value bit pattern (Write)	Determine the method that is used to convert the data read from the measured value I/O number 21] to the 16-bit data. (See the set value bit pattern 23].)		24]
yyyy + E	Output value bit pattern (Write)	<ul style="list-style-type: none"> • Write to the output value I/O number 22] after converting the results of the FUN 2 process or PID calculation according to the output value bit pattern 25]. • Use a value between H0001 and H0004 in *4 depending on the type of output I/O. 		25]
yyyy + F ↓ yyyy + 2F	PID calculation area (Cannot be used by the user)	Do not use this in user programs because this is used by FUN 0, FUN 1, and FUN 2 processing.		26]

*3 Refer to the following page (set value bit pattern) for details.

*4 Refer to the following page (output value bit pattern) for details.

■ Set value bit pattern

H0001 : 8-bit → 16-bit

H0002 : 12-bit unsigned → 16-bit

H0003 : 12-bit signed → expand the sign to 16-bit

H0004 : Do not convert

■ Output value bit pattern

H0001 : 16-bit → 8-bit

If values are H0FFF through H7FFF before conversion, the values are converted to H00FF.

If values are H8000 through HFFFF before conversion, the values are converted to H0000.

H0002 : 16-bit → 12-bit

If values are H0FFF through H7FFF before conversion, the values are converted to H00FF.

If values are H8000 through HFFFF before conversion, the values are converted to H0000.

H0003 : 16-bit signed → 12-bit signed

If values are H0FFF through H7FFF before conversion, the values are converted to H07FF.

If values are H8000 through HF000 before conversion, the values are converted to H0800.

H0004 : Do not convert

(c) Details of word tables used for each loop

Address	PID management table	Details	Remarks
zzzz	Execution flag (Write)	<ul style="list-style-type: none"> When the Execution flag starts up (0 → 1), the PID constant at that time is checked and the PID calculation value is initialized. If successful, the PID RUN flag 58] is set to "1." If there is an error, the PID RUN flag 58] is set to "0" and PID calculation will not be performed. PID calculation is performed while the Execution flag = 1. When the Execution flag = 0, the PID calculation will end and the output will become "0." 	50]
zzzz + 1	Non-bumpless flag (Write)	0 : Perform Bumpless processing 1 : Perform non-bumpless processing	51]
zzzz + 2	PID constant change flag (Write)	<ul style="list-style-type: none"> When the PID Constant Change flag is turned from OFF → ON, the PID constant that is used for the PID calculation is read again, and this value is used to perform calculations. After the PID constant change is complete, this flag must be turned OFF by the user. If there is an error in the PID constant (PID Constant OK = 0), the PID calculation value based on the previous PID constant will be used and the operation will continue. 	52]
zzzz + 3	S flag (Write)	When the S flag is set to "1", it reverts the output value to its initial value. It performs the following output depending on the relationship between Output Upper Limit Value 17], Output Lower Limit Value 18], and Initial Values 19]. Output Lower Limit Value 18] > Output Upper Limit Value 17] ... No output Output Lower Limit Value 18] ≤ Initial Value 19] ≤ Output Upper Limit Value 17] ... Outputs Initial Values 19] Output Lower Limit Value 18] ≤ Output Upper Limit Value 17] ≤ Initial Values 19] ... ≤ Outputs Output Upper Limit Value 17] Initial Values 19] ≤ Output Lower Limit Value 18] ≤ Output Upper Limit Value 17] ... Outputs Output Lower Limit Value 18] The S flag takes priority over the R Flag.	53]
zzzz + 4	R flag (Write)	When the R flag is set to "1", it clears the output value to 0.	54]
zzzz + 5	D-FREI flag (Write)	0 : Calculate PID without performing integrals or derivatives. 1 : Calculate PID using integrals or derivatives.	55]
zzzz + 6	Unused		
zzzz + 7	Unused		
zzzz + 8	PID RUN flag (Read)	<ul style="list-style-type: none"> When the FUN 1 detects the startup of the Execution flag 50], 12] through 16] and 20] through 22] will be checked for logical validity and the result will be set to the PID RUN flag 58]. 1 : Valid 0 : Invalid If the Execution flag 50] startup is detected by the FUN 1 when the PID RUN flag 58] = 1, PID RUN 58] becomes 0 and the PID process will end. 	58]
zzzz + 9	PID calculation in progress flag (Read)	• Sets the PID Calculation in Progress flag 59] in the loop in which the FUN 2 calculates the PID to "1," and sets all PID Calculation in Progress flags in other loops to "0."	59]
zzzz + A	PID constant OK flag (Read)	• When the FUN 1 detects the startup of the PID Constant Change flag 52], the PID constants 12] through 16] will be checked for logical validity and the result will be set in the PID Constant OK Flag 60].	60]
zzzz + B	Upper limit over flag (Read)	• If the PID output value calculated by the FUN 2 is greater than the output upper limit UL 17], the Upper Limit Over flag 61] will be set to "1."	61]
zzzz + C	Lower limit over flag (Read)	• If the PID output value calculated by the FUN 2 is greater than the output lower limit LL 18], the Lower Limit Over flag 62] will be set to "1."	62]

The cause of the error is set in error code 2 2]. PID calculation will still be executed even if an error is generated. If there is no error, the FUN 2 Error flag 63] = 0. Nothing will be set to error code 2 2].	63]
zzzz + E	Unused		
zzzz + F	Unused		

(2) PID operation execution format

(Example 1) Using two loops with both loops set as $TZ = 2 (\times 20 \text{ ms})$ 

PID Operation Execution Control (2 loops)

(Example 2) Using three loops set as follows:

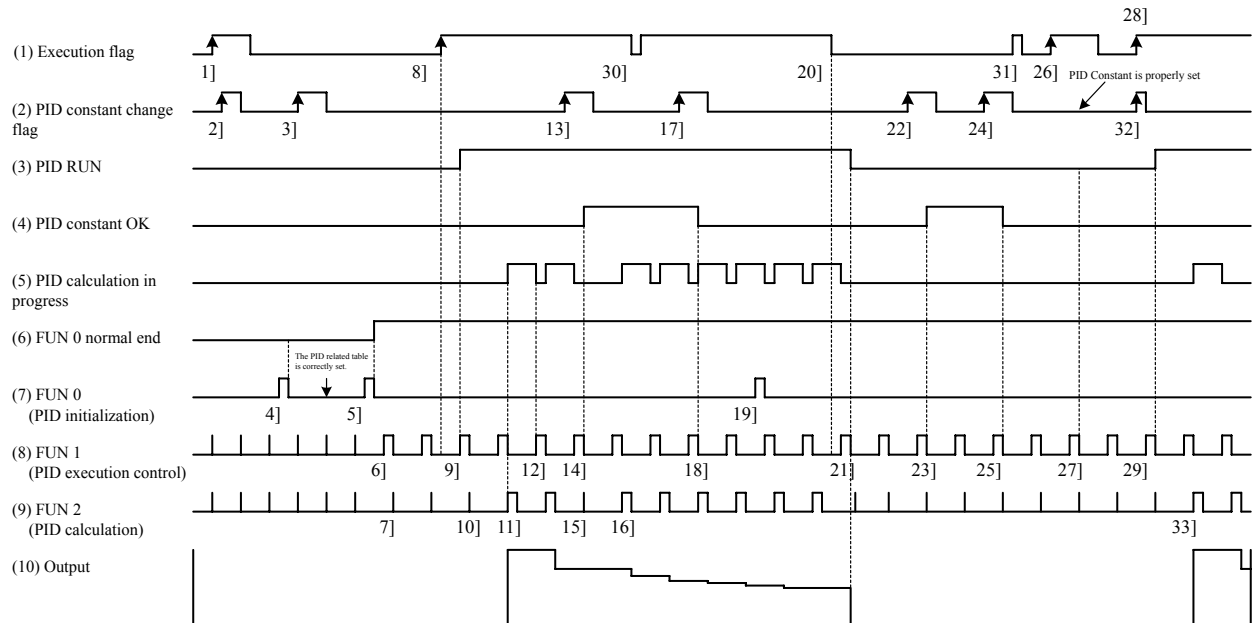

Loop1: $TZ = 3 (\times 20 \text{ ms})$ Loop2: $TZ = 6 (\times 20 \text{ ms})$ Loop3: $TZ = 12 (\times 20 \text{ ms})$ 

PID Operation Execution Control (3 loops)

(3) PID operation timing chart

(a) Timing chart example 1

The following timing chart shows the operation of the PID RUN flag, PID constant OK flag, PID calculation in progress flag, FUN 0, FUN 1, and FUN 2 when the execution flag and PID constant change flag is turned from ON to OFF in a single loop.

Description of timing chart example 1

- 1] This is ignored since FUN 0 is not executed properly even when the execution flag, 2] and 3] of the PID constant change flag are turned on.
- 4] No process will be performed even if FUN 1 is executed because there was an error in the PID related table during FUN 0 processing.
- 5] 6] FUN 1 processing will be started because the FUN 0 processing ended normally.
- 7] FUN2 will not perform PID calculations because the execution flag is off.
- 8] 9] FUN 1 will detect turning on of the execution flag and will check the PID constant. Since it is normal, the PID constant will be calculated and the PIDRUN flag will be turned on.
- 10] The PID calculation of FUN 2 will not be performed on the first scan, so it will start with 11] FUN 2.
- 11] FUN 2 will turn the PID calculation in progress flag before calculating the PID.
- 12] FUN 1 will turn off the PID calculation in progress flag.
- 13] 14] FUN 1 checks the PID constant when the PID constant change flag is turned on. Since it is normal, the PID constant OK flag is turned on and the PID constant will be changed.
- 15] Since PID calculations are not performed in FUN 2, PID calculations will be performed from 16] FUN 2 according to the PID constant after it has been changed.
- 17] When the PID constant change flag was turned on, 18] FUN 1 checked the PID constant. An error was detected, so the PID constant OK flag is turned off. The PID constant flag will not be changed.
- 19] FUN 0 will be ignored when re-executed during PID operation.
- 20] Since 21] FUN 1 detected turning off of the execution flag, the PIDRUN flag will be turned off and the output will be set to 0.
- 21] Since 23] FUN 1 detected turning on of the PID constant change flag when the execution flag was off, the PID constant will be checked. Since it is valid, the PID constant will be changed and the PID constant OK flag will be turned on.
- 24] Since 25] FUN 1 detected turning on of the PID constant change flag when the execution flag was off, the PID constant will be checked. Since there was an error, the PID constant OK flag will be turned OFF.
- 26] 27] FUN 1 will detect turning on of the execution flag and check the PID constant. Since an error was detected, the PIDRUN flag will be turned off.
- 28] Since 29] FUN 1 detected turning on of both the execution flag and the 32] PID constant change flag simultaneously, turning on of the 32] PID constant change flag will be ignored. 29] FUN 1 checks the PID constant, and since it is normal, the PIDRUN flag will be turned on. PID calculation will be started from 33] FUN 2.
- 30] 31] If the execution flag turns from on to off in a timing such that the cyclic interrupt cannot detect it, it will be ignored.

(b) Timing chart example 2

The following is an operation timing chart in respect to the S flag and R flag (bumpless).

S flag.....Sets the output value to the initial value.

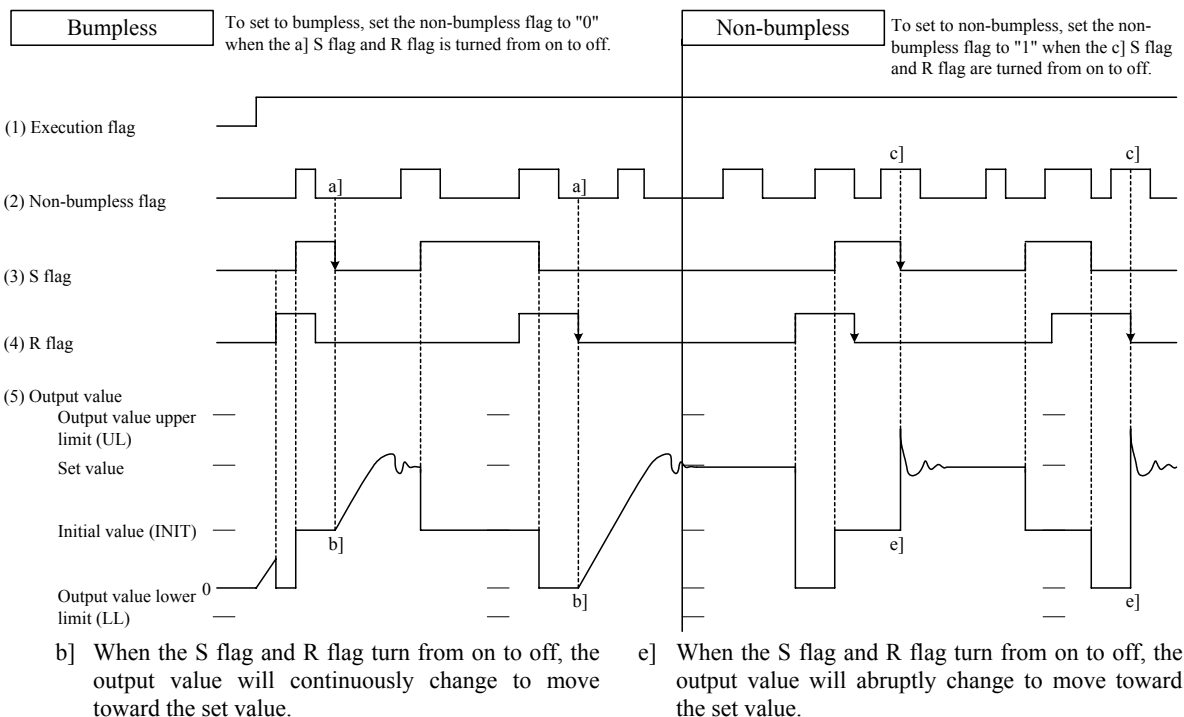

R flag.....Sets the output value to 0.

- a] g] The output value is still INIT because the S flag takes priority.
- b] e] The output value is retained since the execution flag is off.
- c] j] The output value is set to INIT because the S flag takes priority.
- d] k] The output value will be 0 wince the R flag is on when the S flag turns off.
- f] The output value will be INTT.
- h] l] The output value will continuously move toward the target value since the execution flag is on and bumpless.
- i] The output value will be 0.

(c) Timing chart example 3

Bumpless and non-bumpless

b] When the S flag and R flag turn from on to off, the output value will continuously change to move toward the set value.

e] When the S flag and R flag turn from on to off, the output value will abruptly change to move toward the set value.

(4) PID command error code details

Error codes are shown using a 4-digit hexadecimal value.

The last 2 digits show the cause of the error.
Shows the loop number.
In the case of H00, it is an error that has no relation to loop numbers.
In the case of H01 through H04, there is an error in the loop shown in the loop number.

(a) Error code 0

The error codes generated in FUN 0 processing and some parts of FUN 1 processing are set in error code 0.

If there is no error, the previous status will be maintained.

Error code	Contents and cause	Corrective action	Remarks
0001	The FUN 0 was executed again after the FUN 0 had been successfully completed.	Do not execute the FUN 0 after it has been executed successfully.	"FUN 0 normal completion 5]" maintains the previous value.
0002	The number of loops 3] is 0.	Set the number of loops 3] to a value between the range of 1 to 64.	
0003	The number of loops 3] exceeds 65.	Set the number of loops 3] to a value between the range of 1 to 64.	
0004	The PID control table exceeds the maximum number of WR.	Change the head of PID management table or the number of loops 3] so that the maximum number of WR is not exceeded.	The size of the PID management table will change. If the number of loops 3] exceeds the suffix of the I/O, "FUN 0 normal completion 5]" will maintain the previous value.
××05	The word table of loop ×× exceeds the maximum number of WR.	Set the number in the WR for the loop 4] again.	The size of the bit table is 16 bits per loop.
××06	The bit table of loop ×× exceeds the maximum number of R.	Set the bit number for R 11] again.	The size of the bit table is 16 bits per loop.
××07	The output upper limit value 17] in loop ×× is outside of range.	Set the output upper limit value 17] to a value between -32,767 and 32,767.	
××08	The output lower limit value 18] in loop ×× is outside of range.	Set the output lower limit value 18] to a value between -32,767 and 32,767.	
××09	The initial value 19] in loop ×× is outside of range.	Set the initial value 19] to a value between -32,767 and 32,767.	
××0A	There is an error in the size relationship between the output upper limit value 17], output lower limit value 18], and initial value 19].	Perform settings so that the output lower limit value 18] ≤ initial value 19] ≤ output upper limit value 17] is met.	
××0B	The set value bit pattern 23] in loop ×× is outside of range.	Set the set value bit pattern 23] to a value between 1 to 4.	
××0C	The measured value bit pattern 24] in loop ×× is outside of range.	Set the measured value bit pattern 24] to a value between 1 to 4.	
××0D	The output value bit pattern 25] in loop ×× is outside of range.	Set the output value bit pattern 25] to a value between 1 to 4.	
0020 (Note)	The FUN 1 is being executed when the FUN 0 is not successfully completed.	Do not run the FUN 1 until the FUN 0 is successfully executed.	Set to the error code 0 specified by the (S) in the FUN 1 (S).
0021 (Note)	The S in the FUN 1 (S) is different from the S in the FUN 0 (S) of the PID management table.	Set the same WR for the S in the FUN 1 (S) and the S in the FUN 0 (S).	Set to the error code 0 specified by the (S) in the FUN 1 (S).

(Note) Error codes 0020 and 0021 will over-write the errors generated previously (0001 to ××0D). Therefore, execute the FUN 1 after verifying that the FUN 0 is successfully executed.

(b) Error code 1

The error code generated in the FUN 1 process is set in error code 1. If there is no error, the previous condition is maintained.

Error code	Contents and cause	Corrective action	Remarks
0020	The FUN 1 is being executed when the FUN 0 is not successfully completed.	Do not run the FUN 1 until the FUN 0 is successfully executed.	Set to the error code 0 specified by the (S) in the FUN 1 (S).
0021	The S in the FUN 1 (S) is different from the S in the FUN 0 (S) of the PID management table 1].	Set the same WR number for the S in the FUN 1(S) and the S in the FUN 0 (S).	Set to the error code 0 specified by the (S) in the FUN 1 (S).
××22	There is an error in the set value I/O number 20] in loop ××.	Set the set value I/O number 20] using the ADRIO command.	These are errors that may be generated when the Execution flag starts up.
××23	There is an error in the measured value I/O number 21] in loop ××.	Set the measured value I/O number 21] using the ADRIO command.	
××24	There is an error in the output value I/O number 22] in loop ××.	Set the output value I/O number 22] using the ADRIO command.	
××25	The sampling time 12] of loop ×× is out of range.	Set the sampling time 12] to a value within the range of 1 to 200.	These are errors that may be generated when the Execution flag starts up or when the PID Constant Change flag starts up.
××26	The sampling time 12] of loop ×× is not a multiple of the number of loops 3].	Set the sampling time 12] so that it becomes a multiple of the number of loops 3].	
××27	The proportional gain 13] of loop ×× is out of range.	Set the proportional gain 13] to a value within the range of -1,000 to 1,000.	
××28	The integral constant 14] of loop ×× is out of range.	Set the integral constant 14] to a value within the range of 1 to 32,767.	
××29	The derivative constant 15] of loop ×× is out of range.	Set the derivative constant 15] to a value within the range of 1 to 32,767.	
××2A	The derivative delay constant 16] of loop ×× is out of range.	Set the derivative delay constant 16] to a value within the range of 1 to 32,767.	There is a possibility that this error is generated when the S flag 53] is turned ON while the PID RUN flag 58] is OFF.
××30	There is an error in the size relationship between the output lower limit value 18] and output upper limit value 17] in loop ××.	Set the values so that the output lower limit value 18] \leq output upper limit value 17] is satisfied.	
××31	There is an error in the output value I/O number 22] in loop ××.	Set the output value I/O number 22] using the ADRIO command.	There is a possibility that these errors are generated when the S flag 53] or R flag 54] is turned on while the PID RUN flag 58] is OFF.
××32	The output value bit pattern 25] in loop ×× is outside of range.	Set the output value bit pattern 25] to a value between 1 and 4.	

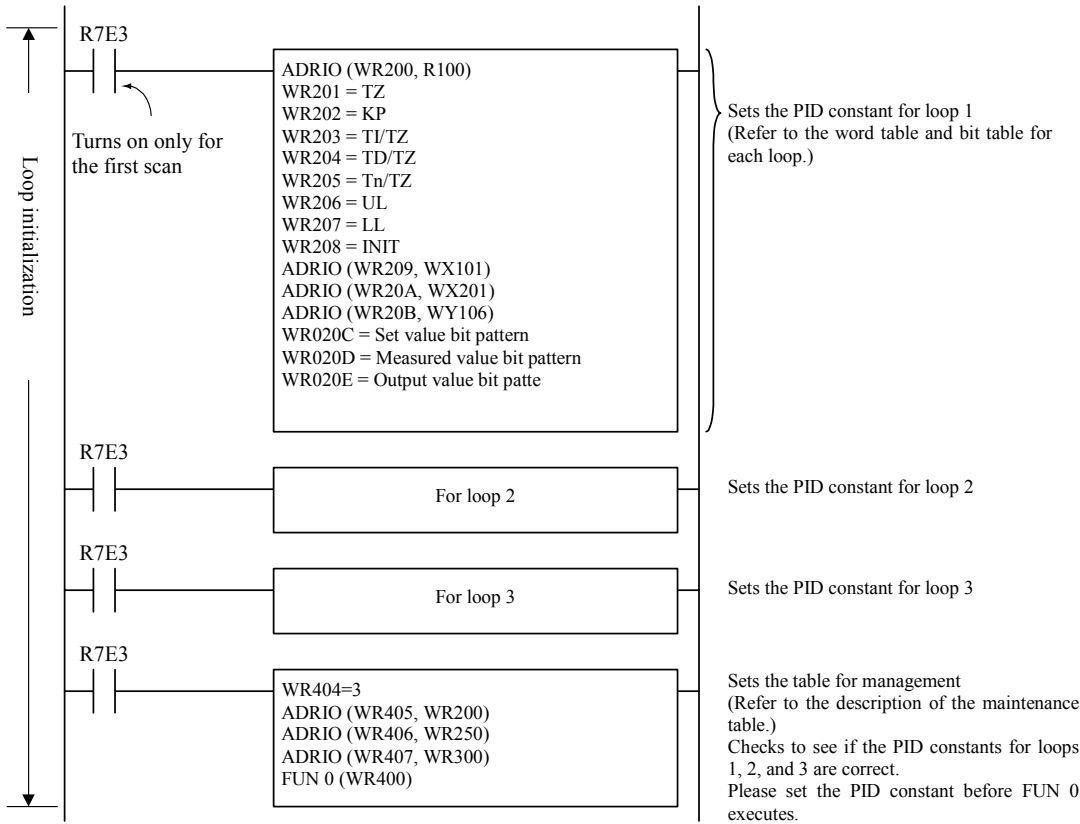

(c) Error code 2

Error code	Contents and cause	Corrective action	Remarks
0040			(Reserv)
××41	The set value bit pattern 23] in loop ×× is outside of range.	Set the set value bit pattern 23] to a value between 1 to 4.	When the bit pattern is outside of range, the process will continue based on "4. Do not convert."
××42	The measured value bit pattern 24] in loop ×× is outside of range.	Set the set value bit pattern 24] to a value between 1 to 4.	
××43	The output value bit pattern 25] in loop ×× is outside of range.	Set the output value bit pattern 25] to a value between 1 to 4.	
××44	There is an error in the size relationship between the output lower limit value 18] and output upper limit value 17] in loop ××.	Set the values so that the output lower limit value 18] \leq output upper limit value 17] is satisfied.	If there is a size relationship error, the process will continue but there will be no output.

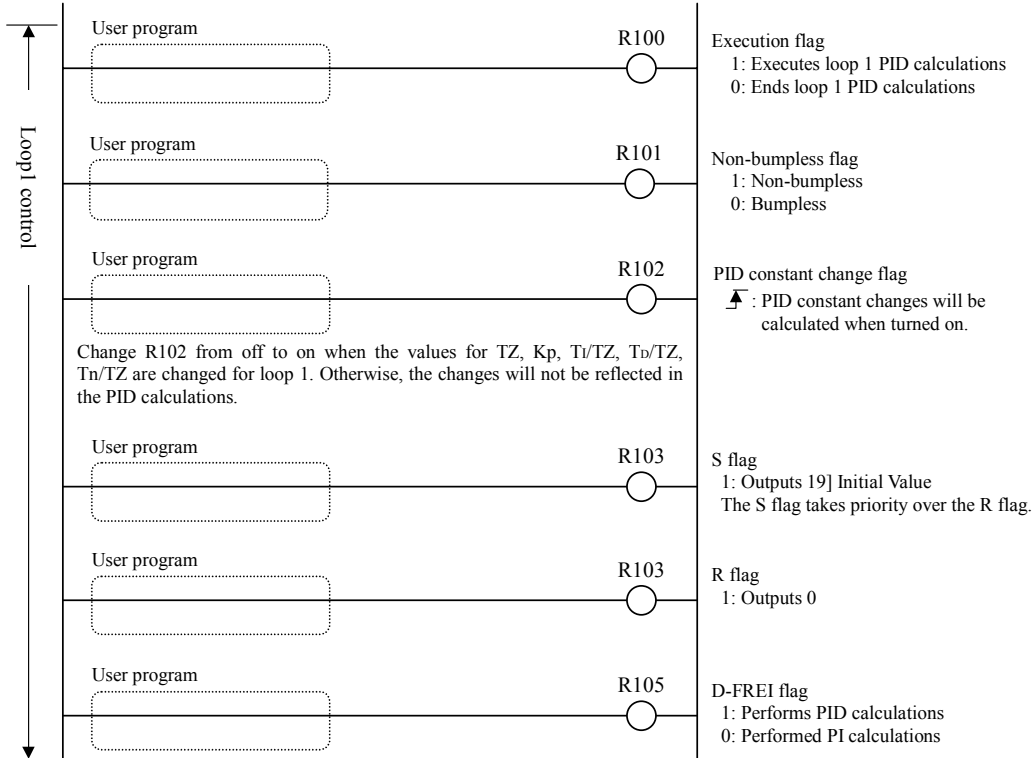

(5) Program example

This program is an example comprised of three loops. This program also rewrites the PID constant every time the CPU starts a RUN process.

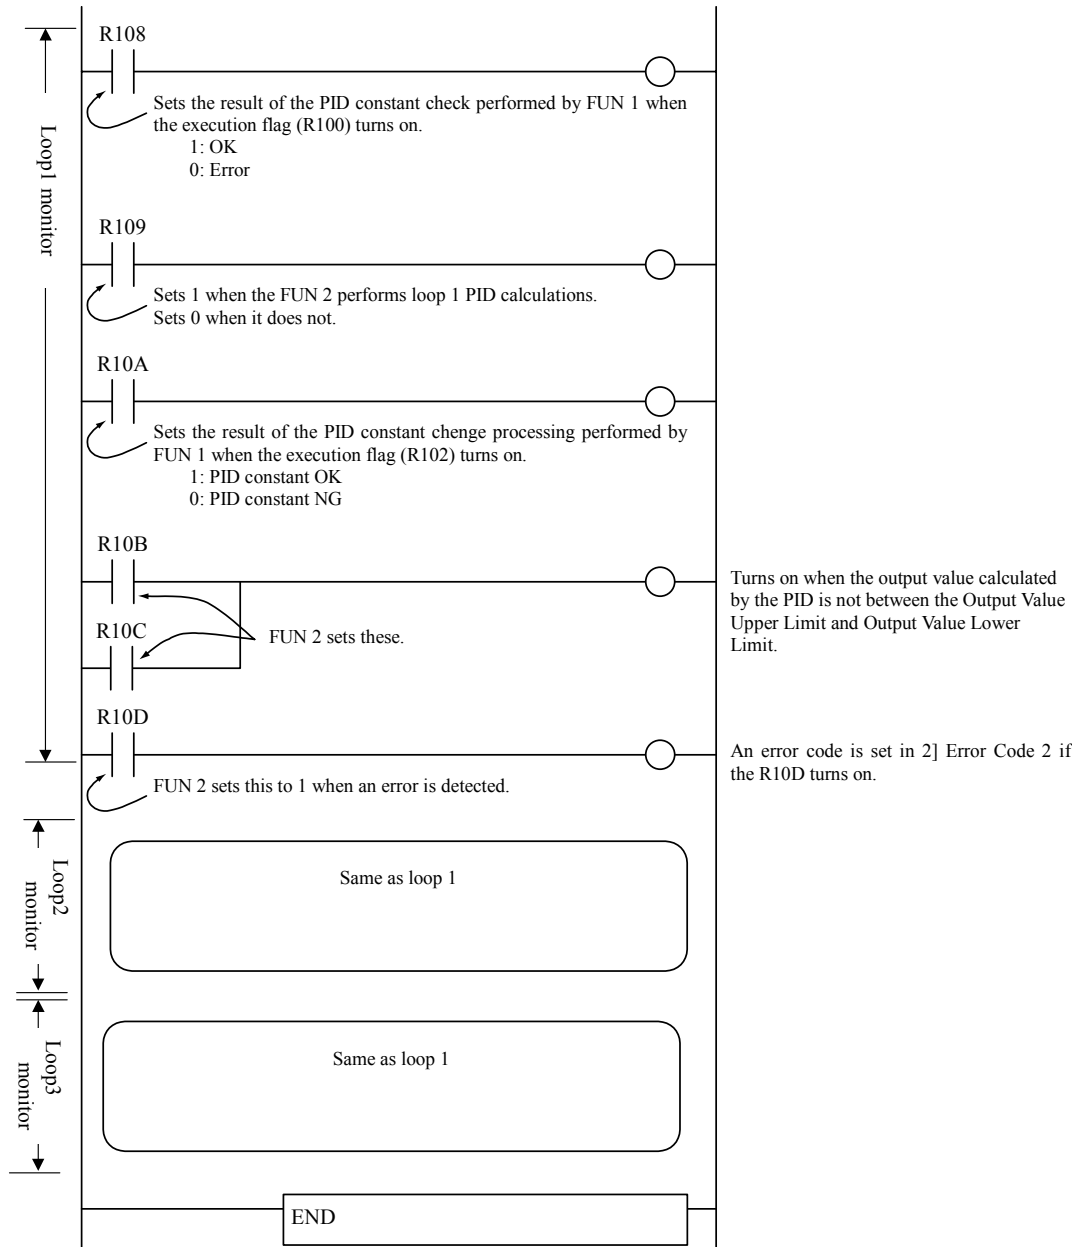

■ Loop Initialization

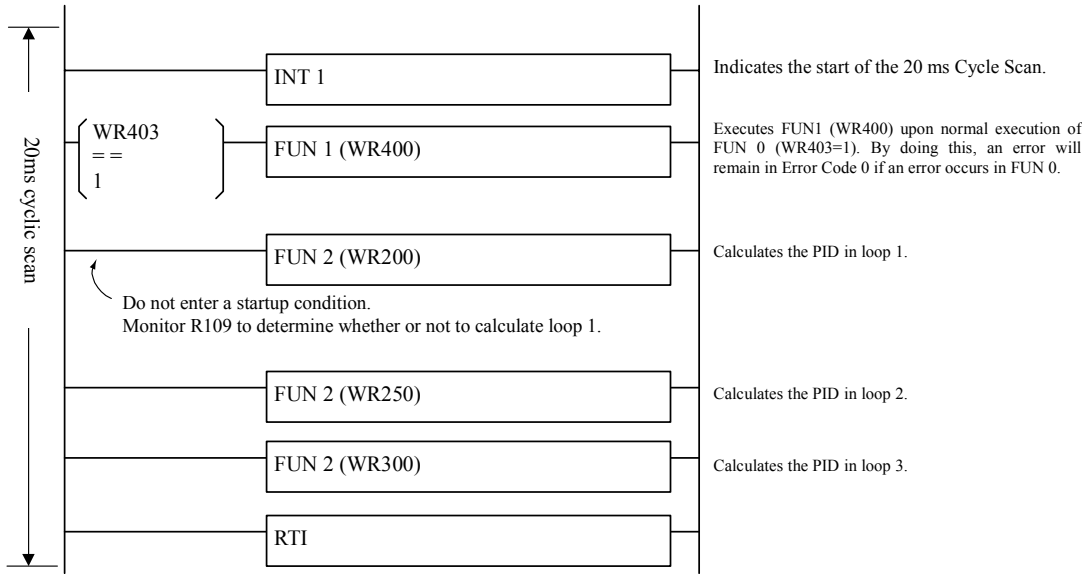

■ Loop control

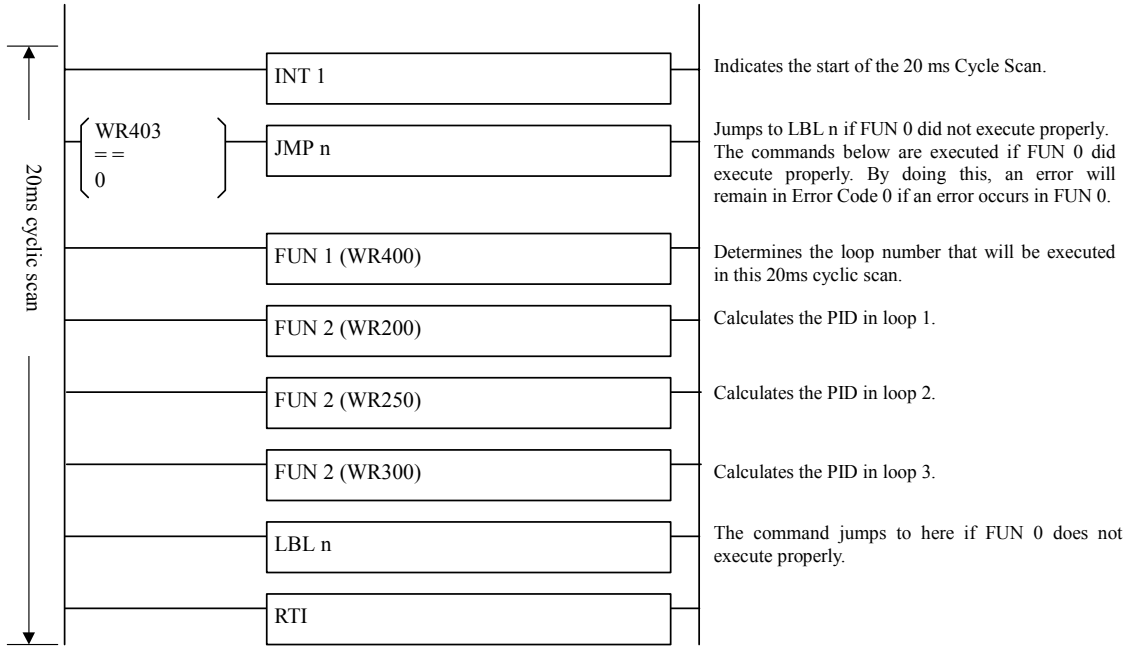

■ Loop monitor

■ 20ms cyclic scan

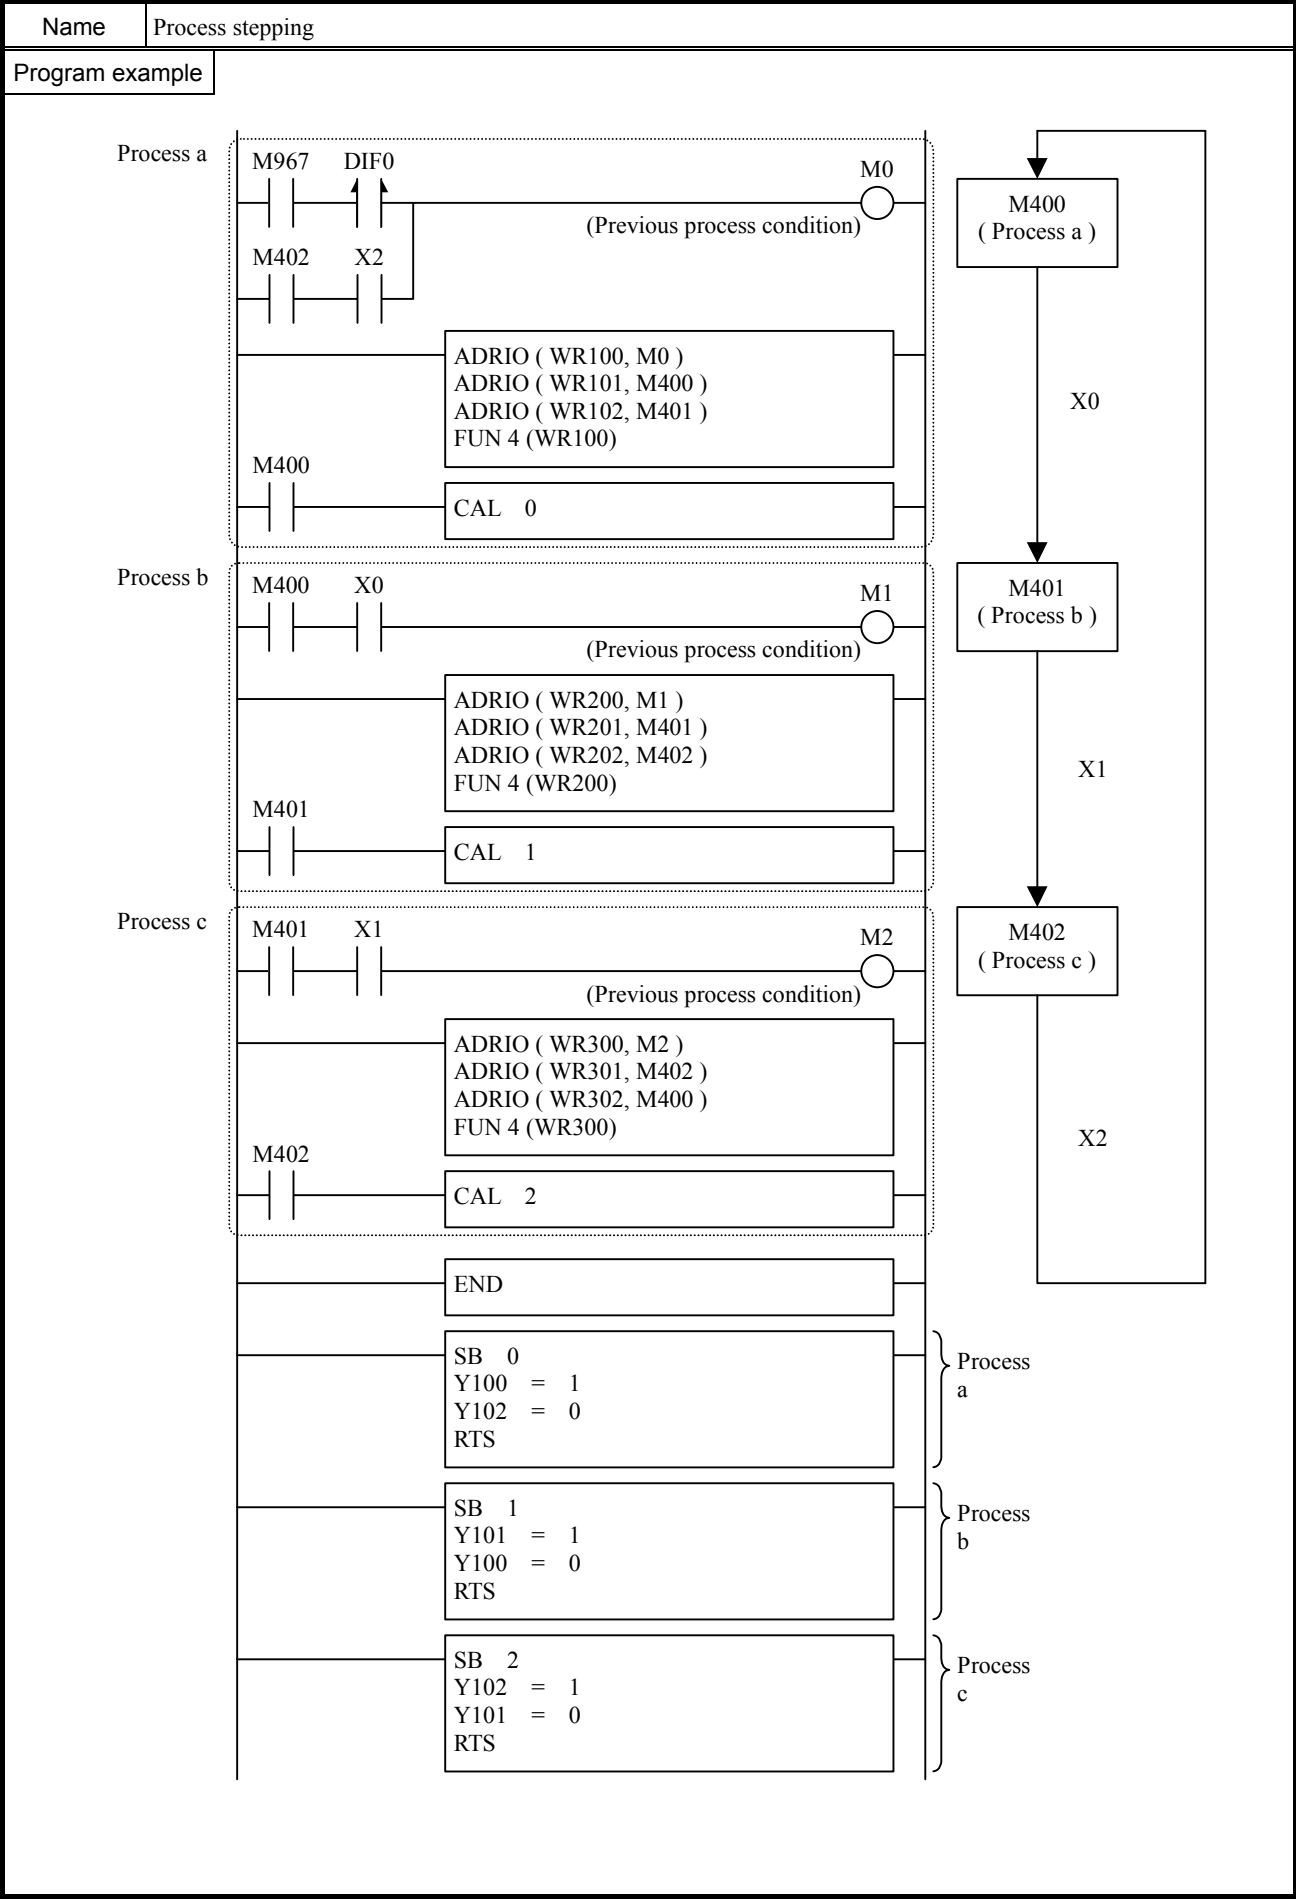

The program on this page can also be as shown below.

Name		Process stepping																
Ladder format				Condition code						Processing time (μs)			Remark					
FUN 4 (s) * [IFR (s)]				R7F4	R7F3	R7F2	R7F1	R7F0	Ave	Max		602		←				
				DER	ERR	SD	V	C										
				↑	●	●	●	●										
Command format				Number of steps														
FUN 4 (s) * [IFR (s)]				Condition			Steps											
				—			3											
Usable I/O				Bit				Word				Double word		Constant	Other			
				X	Y	R, M	TD, SS, CU, CT	WX	WY	WR, WM	TC	DX	DY			DR, DM		
s	Argument								○						s uses up to s+3.			
Function																		
s	Previous process condition I/O number																	
s+1	Process set I/O number																	
s+2	Next process (clear condition) I/O number																	
s+3	Used by the system																	
<ul style="list-style-type: none">• When the I/O designated by s (previous process) switches on, the s+1 (process set) switches on and the state is retained. (The previous process condition is triggered by edge.)• When the I/O designated by s+2 (next process) switches on, the s+1 (process set) is switched off. (The next process is triggered by level.)• When s (previous process) and s+2 (next process) are both on, the s+2 (next process) has the priority.• The user should designate output for each process, if necessary.																		
Cautionary notes																		
<ul style="list-style-type: none">• Set the actual R, L and M address for the parameters s through s+2 using the ADRIO command.• If the areas designated by s to s+2 overlap, if s+1, s+2 or s+3 falls out of range, DER will be equal to “1” and the command will not be processed.• Do not designate the same I/O for arguments of different processes, since the action of the current process is levelled by the previous process.• Each process requires at least one scan time.																		
<div><div>M0967</div><div>X00000 (M400)</div><div>X00001 (M401)</div><div>X00002 (M402)</div><div>Process a</div><div>Process b</div><div>Process c</div><div>t</div><div>t</div><div>t</div><div>t</div></div> <p>t : 1 scan time is necessary</p>																		
In the program example described previously, the external I/O (X, Y) are used as switch signals of a process; thus, the time for performing I/O refresh (i.e., at least one scan period) is required for each process.

Function														
<div><div>s+2</div><div>0° to 180°</div></div> <div>← COS⁻¹</div> <div><div>s+1</div><div>Integer portion</div></div> <div><div>s</div><div>Fractional portion</div></div>														
<div>• Calculates the COS⁻¹ value using the unsigned binary value designated by s (fractional portion) and s+1 (integer portion) as the argument, and outputs s+2.</div> <div>• The COS⁻¹ value is described in degrees in the range of 0° to 180°.</div> <div>• If the calculation is completed normally, DER is equal to “0.”</div> <div>• The fractional data is the value obtained by multiplying the actual value by 65,535.</div>														
Cautionary notes														
<div>• When the argument s+1.s > 1, DER is equal to “1” and operation will not be performed.</div> <div>• When s+1 and s+2 exceed the maximum value for the I/O number, DER is equal to “1” and operation will not be performed.</div>														
Program example														
<div><div><div>X4 DIF4</div><div><div></div><div></div><div></div><div></div></div><div>DR24 = HFFFA871 FUN 14 (WR24)</div></div><div><div>LD X00004 AND DIF4 [DR0024 = HFFFA871 FUN 14 (WR0024)]</div></div></div>														
Program description														
<div>• Set data in DR0024 (WR0024, WR0025).</div> <div>• COS⁻¹ operation is performed at the leading edge of X00004, and the result is set in WR0026 as a binary value.</div> <div>Execution results: WR0026=H006E, WR0025=HFFFF, WR0024=HA871</div>
